An inhabitant of Normandy, a duchy and later a province of northern France bordering on the English Channel; a member of that branch of the Northmen or Scandinavians who in the beginning of the tenth century settled in northern France and founded the duchy of Normandy. They adopted to a large extent the customs and language of the French. In the eleventh century their duke conquered England (see *Norman Conquest*), and about the same time Norman adventurers established themselves in southern Italy and Sicily. Since the reign of John (1199–1216) the duchy of Normandy has been, except for a short period, a part of France.

The *Norman*, with the softened form of his name, is distinguished from the Northman by his adoption of the French language and the Christian religion. *E. A. Freeman*, in Encyc. Brit., XVII. 540.

II. *a.* Of or pertaining to Normandy or the Normans.—**Norman architecture,** a round-arched style of medieval architecture, a variety of the Romanesque, introduced before the Norman Conquest from Normandy into Great Britain, where it prevailed after the Conquest until the end of the twelfth century. The general character of this style is a massive and rugged simplicity, not destitute of studied proportion, and often

with the grandeur attendant upon great size and solidity. The more specific characteristics are—churches cruciform with apse and apsidal chapels, and a great tower rising from the intersection of nave and transept; vaults, plain and semi-cylindrical; doorways, the glory of the style, deeply recessed, often with rich moldings, covered with surface sculpture, sometimes continuous around both jamb and arch, but more usually springing from a series of shafts, with plain or enriched capitals; windows small, round-headed, placed high in the wall, and opening inward with a wide splay; piers massive, cylindrical, octagonal, square, or with engaged shafts; capitals cushion-, bell-, or lily-shaped, sometimes plain, more frequently sculptured in fanciful forms or in a reminiscence of the Corinthian or Ionic; buttresses broad, with but small projection; walls frequently decorated with bands of arcades of which the arches are single or interlaced. Toward the close of the twelfth century the style became much modified. The arches began to assume the pointed form; the vaults to be groined or formed by the intersection of two subsidiary vaults at right angles; the piers, walls, etc., to become less heavy; the towers to be developed into spires; and the style, having assumed in every particular a more delicate and refined character, passed gradually into a new style, the early Pointed. Besides ecclesiastical buildings, the Normans reared many noble and powerful fortresses and castellated structures, the best remaining specimen of which in England is the White Tower or Keep of the Tower of London.—**Norman Conquest,** or simply *the Conquest*, in *Eng. hist.*, the conquest of England by William, Duke of Normandy (William the Conqueror). It was begun by and is usually dated from his victory at Senlac (Hastings) in 1066. The leading results were the downfall of the native English dynasty, the union of England, Normandy, etc., for a time under one sovereign, and the introduction into England of Norman-French customs, language, etc.—**Norman embroidery,** a kind of embroidery consisting of crewel-work which is picked out or heightened by other embroidery-stitches. *Dict. of Needlework.*—**Norman French,** a form of French spoken by the Normans, which became upon the Conquest the official language of the court and of legal procedure, undergoing in England a further development (Anglo-French), until its final absorption in English. (See *English*, 2.) Norman French was the language of legal procedure until the reign of Edward III. Many isolated phrases and formulas in this language (Law French) remain unassimilated in archaic use.—**Norman thrush.** See *thrush.*

Hence *nozle*, *nozzle*, *nuzzle*.] 1. The special organ of the sense of smell, formed by modifications of certain bones and fleshy parts of the face, its cavities, or fossæ, freely communicable with the cavities of the mouth and lungs, and hence also concerned in respiration, the utterance of words or vocal sounds, and taste. It is lined throughout by a highly vascular mucous membrane called the *pituitary* or *Schneiderian*, continuous with the skin through the nostrils, the conjunctiva of the eye, and the mucous membrane of the pharynx and sinuses. It is in this membrane that the fine filaments of the olfactory nerves terminate, and over it the inspired air containing odorous substances passes. The olfactory region, or that region to which the olfactory nerves are distributed, however, includes only the upper and middle turbinate parts of the nasal fossæ and the upper part of the septum; the lower part of the cavities has nothing to do with olfaction. Externally the nose commonly forms a prominent feature of the face or facial region of the head; when very long it becomes a *proboscis*, and may acquire a tactile or manual function, as in the elephant, hog, mole, etc. The nose of an animal when moderately prominent is usually called a *snout*, *muzzle*, or *muffle*. The *bridge* of the nose is so much of its external prominence as is bridged over or roofed in by the nasal bones. The external opening of the nose is the *nostril*, usually paired, right and left, and technically called *nares*. The inner passages or cavities of the nose are the *nasal fossæ* or *meatus*; they open interiorly into the upper part of the pharynx, by orifices called the *posterior nares* or *choanæ*, above the soft palate. The animal whose nose most resembles man's in size and shape is the proboscis-monkey, *Nasalis larvatus*, whose nose is more prominent than that of most men. Prominence of the nose is to some extent an indication of ascent in the scale of human development, the nose being flattest in the lowest or negroid races. A large nose is commonly supposed to indicate strength of character, and thin clean-cut nostrils are generally a sign of high nervous organization. Besides its special function of smelling, the nose has in all animals a respiratory office, being, rather than the mouth, the usual passageway for air in both inspiration and expiration; it also serves to modify or modulate the voice, and to discharge the secretion from several cavities of the head, as the frontal and other sinuses, and the tears from the eyes. See cuts under *mouth*, *nasal*, *Nasalis*, and *Condylura*.

This is shown in ammonites, for example, by the partial or entire loss of the ornamentation which characterizes the adult stage, and a marked decrease in size. In consequence of these progressive changes, a specimen may finally acquire something of the aspect of its own youthful stage.

'nose-hole,' < *nosu*, *nasu*, nose, + *thyrl*, *thyrel*, a hole: see *nose*[1] and *thirl*, *thrill*. The second element became obs. as an independent word, and suffered corruption in the compound.] 1. One of the external openings of the nose; a nasal orifice; a naris or narial aperture. The word is commonly restricted to the external opening. Nostrils are paired, but may be so united as to appear more or less as one. They usually present more or less directly forward, often sidewise, less frequently upward, seldom downward as in man. They are found in almost every shape that a hole can take, and details of their configuration and position often furnish zoölogical characters. In animals below mammals the nostrils are usually, if not always, motionless. In most mammals they are mobile, much more so than in man, being furnished with well-developed muscles for dilatation and contraction or even complete closure. Thus, among cetaceans and various other aquatic mammals the nostrils are perfectly valvular, guarding against the entrance of water. In those animals whose nose is a tactile organ the nostrils are sometimes fringed with processes like tentacles, as in the star-nosed mole. The nostrils of birds are often prominent horny tubes, as those of petrels and some goatsuckers. See cuts under *bill*, *fulmar*, and *Conaylura*.

I will *not*. When *not* qualifies a verb, either individually or as the main word of a proposition, it now almost invariably follows the verb; but in forms compounded with auxiliaries, it follows the auxiliary, or the first of them: as, I think *not*: I do *not* think so; I should *not* have thought so. Except in elevated style, the use of *not* is now almost always accompanied by the use of an auxiliary: as, 'I do *not* see it,' for 'I see it *not*.' *Not*, spoken with emphasis, often stands for the negation of a whole sentence referred to: as, I hope *not* (that is, I hope that the state of things you describe does *not* exist).

notary[1] (nō'tạ-ri), *n.*; pl. *notaries* (-riz). [= F. *notaire* = Pr. *notari* = Sp. Pg. It. *notario* = AS. *notere*, a writer, notary, < L. *notarius*, a stenographer, clerk, secretary, writer, < *nota*, a mark, a sign: see *note*[1].] **1.** In the earlier history of writing, a person whose vocation it was to make notes or memoranda of acts of others who wished to preserve evidence of them, and to reduce to writing deeds and contracts.—**2.** A public officer authorized by law to perform similar functions, and to authenticate the execution of deeds and contracts, and the accuracy of copies of documents, and to take affidavits and administer oaths. Such an officer, although now commonly spoken of as a *notary*, is more formally designated as a *notary public*, or *public notary*. In England these officers are appointed by the Court of Faculties of the Archbishop of Canterbury, the office having arisen under the civil and ecclesiastical law. In France they are appointed by the government, although the power of appointment was formerly claimed by the Pope. In the United States they are appointed in the several States usually by the governor, the power of appointment being defined by the law of the State. The general powers of notaries are not defined by statute, being derived from the civil law and the law merchant; and their official acts, attested by signature and official seal, are generally received in evidence in whatever country they are offered, while similar acts of commissioners and other purely statutory officers are generally receivable only in the jurisdiction for which the officer was appointed, unless specially authenticated by some judicial authority. In various jurisdictions some special powers have been conferred upon notaries besides those derived from the origin and nature of their office.—**Apostolical notary**, an official charged with despatching the orders of the papal see.—**Ecclesiastical notary**, in the *early church*, a clerk or secretary, especially a shorthand-writer, employed to record the proceedings of councils and tribunals, report sermons, take notes, and prepare papers for bishops and abbots.—**Notary public.** See def. 2, above.

notation (nō-tā'shọn), *n.* [= F. *notation* = Sp. *notación* = Pg. *notação* = It. *notazione*, < L. *notatio*(*n*-), a marking, a designation, an observation, the designation of the meaning and derivation of a word, etymology, < *notare*, mark, designate: see *note*[1], *v.*] **1.** The act of noting, in any sense.—**2.** A system of written signs of things and relations (not of significant sounds or letters), used in place of language on account of its superior clearness and brevity. Notations are employed to advantage in every branch of mathematics, in logic, in astronomy, in chemistry, in music, in proofreading, etc. (*a*) Two systems of arithmetical notation are now in use, the Roman and the Arabic. The Roman system is employed for numbering books and their parts, in monumental inscriptions, and in marking timber and other objects with the chisel. A large number in this system is written as follows: As many thousands as possible being taken from the number (without a negative remainder), an M is written for every thousand; five hundred is then taken, if possible, and D is written for it: as many hundreds as possible are next taken, and a C written for each; fifty is next taken, if possible, and L is written for it; as many tens as possible are next taken, and an X written for each; five is then taken, if possible, and V is written for it; and finally an I is written for every unit remaining. But usually instead of IIII is written IV; in place of VIIII, IX; in place of XXXX, XL; in place of LXXXX, XC, etc. Anciently, there were other extensions of this system. The Arabic notation consists in the use of the Arabic figures and decimal places. See *Arabic* and *decimal*. (*b*) In the algebraic notation employed in all branches of mathematical analysis all objects upon which the operations of addition, multiplication, etc., are performed are denoted by letters. These objects are generally quantities (and are so called in describing the notation), though they may be operations, as in the calculus of functions, etc., geometrical conditions, as in enumerative geometry, or propositions, as in the calculus of logic. It is usual to give certain letters certain significations (for which see the letters). Furthermore, ∞ denotes infinite magnitude; π, the ratio of the circumference to the diameter, or 3.14159..; *e*, the Napierian base, or 2.71828..; $\perp$, perpendicular, etc. The sign = placed between two quantities states their equality: as, sp. gr. mercury = 13.5. In like manner, > means 'is greater than,' '< 'is less than.' $\prec$ 'is as small as,' $\succ$ 'is as great as,' $\leqq$ 'is smaller than or equal to,' $\geqq$ 'is greater than or equal to,' $\neq$ 'is not equal to,' $\not<$ 'is not smaller than,' $\not>$ 'is not greater than,' $\sim$ 'is proportional to,' $\equiv$ 'is congruent to,' in the theory of numbers. The last sign is also used to mean 'is identically equal to,' thus stating two relations, one mathematical, the other logical. The sum of two quantities is denoted by writing them with the sign +, called *plus*, between them: as, 3 + 2 = 5. The difference of two quantities is denoted by writing first the minuend, then the sign —, called *minus*, then the subtrahend: as, 5 — 2 = 2. When + or — occurs with no quantity before it, 0 is to be supplied: thus, 3 — 5 = —2 means that 5 less than 3 is 2 below zero. But when a value has + or — after it and no quantity following, what is meant is that

something further is to be added or subtracted. The sign ±, called *plus or minus*, is ordinarily used in a disjunctive sense in writing the root of a quadratic equation. Thus, if $x^2 + x = 1$, we write $x = -\frac{1}{2}(1 \pm \sqrt{5})$, meaning that the equation is satisfied only by the two values $x = -\frac{1}{2}(1 + \sqrt{5})$ and $x = -\frac{1}{2}(1 - \sqrt{5})$. The sign ± is also used in astronomy, geodesy, etc., after a value determined by observation, to introduce the probable error of that determination. Summation is also signified by the letter Σ. Thus, $\sum_1^n i\,(1/i)$ means that in the expression $1/i$ all the whole numbers from 1 to n inclusive are to be successively substituted for i and the resulting values added together to give the quantity denoted by the expression. When the limits are not indicated, the lower one is to be understood as constant, and generally zero, and the upper one as one less than the actual value of the variable. For example, if we write $\Sigma\,(2x + 1) = x^2$, this signifies

$$\sum_0^{x-1} (2n + 1) = x^2.$$

In like manner, Δ is used to signify the difference, or the amount by which the quantity written after it would be increased by increasing the variable by unity. The variable may be indicated by a subjacent letter; thus, $\Delta_x x^y = (x + 1)^y - x^y$; but $\Delta_y x^y = x^{y+1} - x^y = (x - 1)x^y$. The product of two quantities is denoted by writing them in their order, either directly, or with an interposed cross (×) or dot (.); thus, $3 \times a = 3 \,.\, a = 3a$. A quotient is usually denoted by one of the signs ÷ or : or /, with the dividend before it and the divisor after it, or by a horizontal line with the dividend above and the divisor below. A continued product is also written with Π, just as a summation is written with Σ; but when the limits are not indicated, the lower one is constant, and generally unity, and the upper one the actual value of the variable. A positive whole number with the mark of admiration (!) after it denotes the continued product of all numbers from 1 up to that number inclusive; thus, $4! = 24$. Instead of the mark of admiration, a right-angled line beneath and at the left of the number is sometimes used · as, $\lfloor 4$. A power of a quantity is denoted by writing the exponent to the right and above the base; thus, $x^3 = x \,.\, x \,.\, x$. This notation is extended to symbols of operation. Thus, $\Delta^2 u = \Delta\Delta u$; and $\Delta^{-1} u = \Sigma u$, because $u = \Delta\Delta^{-1} u = \Delta\Sigma u$. If the exponent is included in parentheses, the quantity denoted is the continued product of a number of factors equal to the exponent, one factor being the base, and the others the results of successive subtractions of 1 from the base; thus, $x^{(3)} = x\,(x - 1)\,(x - 2)$. A root is denoted either by a fractional exponent, or by the sign √ written before the base, with the index above and to the left; thus, $\sqrt[3]{8} = 2$. If the index is omitted, it is understood to be 2. One of the most important parts of algebraical notation is the use of parentheses, ( ), square brackets, [ ], braces, { }, and vincula or horizontal lines above the expressions, to signify that the symbols so included are to be treated as signifying one quantity. Thus, $(3 + 2) \times 5 = 25$, but $3 + (2 \times 5) = 13$. Functions are usually denoted by operative symbols, especially *f*, F, φ, Φ, written before the variable, the latter being often inclosed in parentheses. If there are several variables, these are inclosed in one parenthesis and separated by commas, as F (*x*, *y*). Various special functions have special abbreviations, as log for logarithm, sin for sine, cos for cosine, tan for tangent, cot for cotangent, sec for secant, cosec for cosecant, vsin for versed sine, sinh for hyperbolic sine, am for amplitude, sn for sine of the amplitude, cn for cosine of the amplitude, etc. (For the special notation of matrices, determinants, graphs, and groups, see those words.) A differential is expressed by *d* before the function, and a partial differential is now generally written with ∂ instead of *d*; the variable is indicated, if necessary, by a subjacent letter. A variation is expressed by a δ before the varying quantity. A differential coefficient is most frequently expressed fractionally as a ratio of differentials, or by $\frac{d}{dx}$, etc., written before the function. But the capital D is often used: thus, $D_x x^y = yx^{y-1}$, and $D_y x^y = \log x \,.\, x^y$. Differentiation relatively to the time is frequently expressed by accents: thus, $s' = D_t s$ and $s'' = D_t s'$. Dots over the letters are also used instead of the accents, this being the original fluxional notation of Newton. The differential coefficients of a function are frequently denoted by accents attached to the operational symbols: thus, $f''x = D_x^2 fx$. A number of other differential operations are indicated by special operational symbols, as ∇ for Laplace's operator. The integral of an expression is written with the sign ∫, introduced by Leibnitz, before the differential. The limits of a definite integral are written above and below this sign. Besides these notations, there are many others peculiar to different branches of mathematics.

3†. Etymological signification; etymology.

The *notation* of a word is when the original thereof is sought out, and consisteth in two things: the kind and the figure. *B. Jonson*, Eng. Grammar, viii.

4. In *music*, the act, process, or result of indicating musical facts by written or printed characters. As a process and a science, musical notation is a branch of semiotics or semiography in general. *Notation* is also used as a collective term for all the signs for musical facts taken together. Notation, whether regarded as a science or as a body of visible characters, may be divided into notation of pitch, of duration, of force, of style, etc. The various historic systems of notation are more particular about pitch than about the other matters. (*a*) The absolute and relative pitch of tones has been represented by letters, by neumes, by syllables, by numerals, by a staff, and by more than one of these methods at once. The ancient Greeks and Romans used their alphabets, assigning sometimes a separate letter or similar character to each tone of their tonal systems, and sometimes using only seven letters, which were repeated for successive octaves. The medieval notations included all the different methods, used both separately and in conjunction, letter-names being derived from the ancient notations, neumes appearing early from an unknown source, and solmization and the staff-system being invented and developed from about the eighth or ninth century. Modern notations include all varieties except neumes. See *letter-name*, *neume*, *solmization*, *numeral*, *keyboard*, *scale*, *staff*, etc. (*b*) The absolute and relative duration of tones has been much less fully indicated than pitch. The ancient and medieval systems were decidedly defective in this regard. The appearance about the twelfth century of mensurable music necessitated the use of characters having a definite metrical value; hence came the note-system, which was combined with the staff, and also the various systems of tablature. In modern music two methods are used — notes whose shape indicates relative time-value, and a kind of tablature peculiar to the tonic sol fa system. (See *note*, *tablature*, *tonic sol-fa* (under *tonic*), etc.) Furthermore, the general tempo of a piece or passage is indicated by such Italian terms as *grave*, *adagio*, *andante*, *moderato*, *allegro*, *vivace*, *presto*, etc. Alterations of tempo during a piece are indicated by *accelerando*, *più mosso*, *stringendo*, *ritardando*, *ritenuto*, *calando*, etc. The metrical treatment of individual tones is marked by *staccato*, *legato*, etc. (*c*) The absolute and relative force or accent of tones is still less fully indicated than pitch or duration. Vertical lines called *bars* have been used since medieval times to indicate rhythmical and metrical sections or measures, each of which begins with a primary accent. In modern music various words and arbitrary signs are used, as *forte*, *piano*, *crescendo* (<), *diminuendo* (>), *marcando*. (*d*) Other signs of various practical import are the *brace*, *repeat*, *da capo*, *dal segno*, *double bar*, *slur*, etc. See these words. (*e*) The general style of a piece or passage is often indicated in modern music by such terms as *ad libitum*, *agitato*, *arpeggio*, *cantabile*, *espressivo*, *sostenuto*, *con brio*. (*f*) Specific directions about performance by the voice or an instrument also occur, as *mezza voce*, *arcato*, *portamento*, *divisi*, *mano sinistra*, *pizzicato*, *8va* (*ottava*), *pedal*, and many others. All these verbal marks are translated into different languages, and are subject to modification for particular effects. (*g*) Modern music, following the later medieval music, also employs to some extent a kind of numerical shorthand for harmonic facts. See *thorough-bass*, and *figured bass* (under *bass*[3]). — **Alphabetic notation**, in *music*. See def. 4 (*a*). — **Architectural notation**, a method adopted of placing signs to figures when marking dimensions on drawings: as ′ for feet, ″ for inches, and ‴ for parts, etc. — **Chemical notation**, a system of abbreviating and condensing statements of the chemical composition of bodies, and of their changes and transformations, by means of symbols. See *chemical formula*, under *chemical*. — **Decimal notation**. See *decimal*. — **Neumatic notation**, in *music*. See def. 4 (*a*), above, and also *neume*. — **Numerical notation**, in *music*. See def. 4 (*g*), above, and *numerical*. — **Stafi-notation**, in *music*. See def. 4 (*a*) and (*b*), above, and also *staff* and *note*. — **Tonic sol-fa notation**, in *music*. See *tonic*.

5. A mark on the margin of a book drawing attention to something in the text; hence, a statement subsidiary to the text of a book elucidating or adding something; an explanatory or critical comment; an annotation. In *printing:* (*a*) An explanatory statement, or reference to authority quoted, appended to textual matter and set in smaller type than the text. Notes are of several kinds. A *cut-in note* is set in a space left in the text, near the outer margin, and as nearly as possible in line with the matter referred to. A *center-note* is placed between two columns, as in cross-references in some editions of the Bible. A *side-note* or *marginal note* is placed in the outer margin of the page, parallel with the lines of the text. A *foot-note*, or *bottom note*, follows the text at the foot of the page, but does not encroach on the margin, as *side-notes* do. A *shoulder-note* is one at the upper inner corner of a page. In some countries, as China and Japan, all notes are placed at the top of the page. (*b*) One of the marks used in punctuating the text: as, the *note* of admiration or of exclamation (!); the *note* of interrogation (?).

6. A minute or memorandum, intended to assist the memory, or for after use or reference: as, I made a *note* of the circumstance: generally in the plural: as, to take *notes* of a sermon or speech; to speak from *notes*.

11. A diplomatic or official communication in writing. A note is, in a strict sense, an official communication in writing from the Department of Foreign Affairs (or of State) to a foreign diplomatic representative, or vice versa; it is distinguished from an *instruction*, sent by the department to one of its own diplomatic or consular representatives abroad, and from a *despatch*, sent by the representative abroad to his own department at home.

Fortnightly Rev., N. S., XXXIX. 286.

12. A small size of paper used for writing letters or notes.—**13.** In *music:* (*a*) In the staff-notation, a character or sign by which a tone is recorded and represented to the eye. A note consists of from one to three parts—the *head*, the *stem* or *tail*, and one or more *pennants*, *flags*, or *hooks*,  or  , which are often extended from one note to another in the form of bars, when two or more notes of the same denomination are grouped together,  . The pitch of the tone is indicated by the position of the note on the staff relative to the clef and the key-signature. (See *staff*, *clef*, *signature*, *key*.) The relative duration of the tone is indicated by the shape of the note. The system of notes now in use includes the following: the *breve*,  ; the *semibreve* or *whole-note*,  ; the *minim* or *half-note*,  ; the *crotchet* or *quarter-note*,  ; the *quaver* or *eighth-note*,  ; the *semiquaver* or *sixteenth-note*, ; the *demisemiquaver* or *thirty-second-note*,  ; and the *hemidemisemiquaver* or *sixty-fourth-note*,  . Each of these notes may be placed upon any staff-degree, and thus may signify a tone of any pitch whatever. Each of them, also, may have any time-value whatever, but when in a particular piece or passage a definite time-value is assumed for any one of them, a breve is then regarded equal in that piece or passage to two semibreves, a semibreve to two minims, a minim to two crotchets, etc. In other words, as a metrical notation, this system of notes is relative to an assumed value for one species, but absolute and definite after such an assumption. The pitch-value of a note may be modified by an *accidental* (which see), though the latter may also be regarded as changing the staff rather than the note. The time-value of a note may be modified by various marks, such as a *dot* after it (as  or ), which lengthens the note by one half its original value; the *tie* (or ), which binds two notes on the same pitch together and adds their respective values together; the *pause*, *hold*, or *fermata* ( or ), which lengthens the value of the note indefinitely according to the will of the performer; the *staccato* ( or ), which shortens the actual duration of the note and supplies the deficiency by a silence or rest. (See the various words.) This system is derived from the medieval systems, though with important changes. The Gregorian system of notes, which is still in use, is much nearer to the medieval system. It includes the following notes: the *large*,  ; the *long*,  ; the *breve*,  ; and the *semibreve*, or . These in turn were derived from the early neumes. They were first used merely as indications of pitch, their time-value being indefinite, and dependent wholly upon the text sung to them; but they acquired a definite metrical significance under mensurable music. In modern usage they are generally treated as metrical. A special development of the ordinary system of notes is that of *character-notes*, which are varied in shape so as to indicate not only various time-values, but also the scale-values or characteristic qualities of the tones indicated. Thus, the tonic or *do* is always represented by one shape, the dominant or *sol* by another, the subdominant or *fa* by a third, etc. The system thus aims to secure at once the utility of the staff and of a reference to the abstract scale. (*b*) A musical sound or tone, in general or particular: as, the *note* of a bird; the first *note* of a song, etc. [This use of the word, as applied to musical tones, is very common, but is confusing and inaccurate.]

6. In *law:* (*a*) Information; knowledge of facts: more specifically designated *actual notice.* Actual notice may be inferred from circumstances, as where proof of due mailing of a letter justifies the inference that he to whom it was addressed became cognizant of its contents; but he may disprove the fact, and thus destroy the inference. (*b*) Such circumstances as ought to excite the attention of a person of ordinary prudence, and lead him to make further inquiry which would disclose the fact: more specifically designated *constructive notice.* Constructive notice is imputed by the law irrespective of the existence of actual notice, as where a deed is recorded, and a purchaser of the land neglects to consult the record, in which case the record is constructive notice; or where a purchaser takes a title from the former owner of land, relying on the fact that the record title is in him, while in fact a prior purchaser is in actual possession of the land, having paid for it, in which case the possession is constructive notice; and in either case the later purchaser, not having made inquiry, may be chargeable as if he had had actual notice of the prior purchaser's right. Constructive notice originated in the equitable rule that a man may, for the protection of the rights of a third person, be treated as if he had notice, when he had the means of information. Thus, the general enunciation of a geometrical theorem is comprehended by means of notions, and only in that way can the property to be proved be firmly seized by the mind, and kept distinct from other properties of the same figure; but in order to prove the theorem a construction or diagram is requisite, involving a representation in the imagination capable of being studied so as to observe hitherto unknown relations in it.

Burgersdicius, tr. by a Gentleman, I. ii. 4.

Concept or *notion* are terms employed as convertible; but, while they denote the same thing, they denote it in a different point of view. Conception, the act of which concept is the result, expresses the act of comprehending or grasping up into unity the various qualities by which an object is characterized; *notion*, again, signifies either the act of apprehending, signalizing — that is, the remarking or taking note of the various notes, marks, or characters of an object which its qualities afford; or the result of that act. . . . The term *notion*, like conception, expresses both an act and its product.

3. In the *Lockian philos.*, a complex idea.

The mind often exercises an active power in making these several combinations; for, it being once furnished with simple ideas, it can put them together in several compositions, and so make variety of complex ideas, without examining whether they exist so in nature. And hence I think it is that these ideas are called *notions*, as if they had their original and constant existence more in the thoughts of men than in the reality of things.

It is one of the earliest embryonic structures, and persists throughout life in many of the lower vertebrates, which are on this account called *notochordal;* but in most cases it is soon absorbed and replaced by a definite cartilaginous or bony spinal column. The soft pulpy substance which may be seen filling in the cupped ends of the vertebræ of a fish, as brought to the table, is a part or the remains of the notochord. Anteriorly, in skulled vertebrates, the notochord runs into the base of the skull as far as the pituitary fossa. (See *parachordal.*) The caudal division of a notochord is often called *urochord.* Such a structure is characteristic of tunicates or ascidians, called on this account *Urochorda*, and approximated to or included among vertebrates. (See *Appendicularidæ.*) A sort of notochord occurring in the acorn-worms has caused them to be named *Hemichorda.* (See *Balanoglossus* and *Enteropneusta.*) The lancelets are named *Cephalochorda* with reference to the extension of this structure into the head. If I admit things which are objects of the understanding only, and nevertheless can be given as objects of an intuition, though not of sensuous intuition (as coram intuitu intellectuali), such things would be called *Noumena* (intelligibilia). . . . Unless, therefore, we are to move in a constant circle, we must admit that the very word phenomenon indicates a relation to something the immediate representation of which is no doubt sensuous, but which nevertheless, even without this qualification of our sensibility (on which the form of our intuition is founded), must be something by itself, that is, an object independent of our sensibility. Hence arises the concept of a *noumenon*, which, however, is not positive, nor a definite knowledge of anything, but which implies only the thinking of something without taking any account of the form of sensuous intuition. But, in order that a *noumenon* may signify a real object that can be distinguished from all phenomena, it is not enough that I should free my thought of all conditions of sensuous intuition, but I must besides have some reason for admitting another kind of intuition besides the sensuous, in which such an object can be given, otherwise my thought would be empty, however free it may be from contradictions. . . . The object to which I refer any phenomenon is a transcendental object. . . . This cannot be called the *noumenon*.
Kant, Critique of Pure Reason (tr. by Max Müller, 1881), [pp. 217, 219.

In a negative sense, a *noumenon* would be an object not given in sensuous perception; in a positive sense, a *noumenon* would be an object given in a non-sensuous, i. e. an intellectual, perception.
E. Caird, Philos. of Kant, p. 498.

(*b*) Inexactly, a thing as it is apart from all thought; what remains of the object of thought after space, time, and all the categories of the understanding are abstracted from it; a thing in itself.

II. *n.* In *church hist.*, one of a sect founded in the middle of the third century by Novatianus (also called Novatus), a presbyter of Rome, who had himself consecrated bishop of Rome in opposition to Cornelius in 251. Another Novatus (of Carthage) was joint founder of the sect. Novatianus denied that the church had power to absolve or restore to communion those who after Christian baptism had lapsed or fallen into idolatry in time of persecution, and his followers appear to have refused the grant of forgiveness to all grave post-baptismal sin and denied the validity of Catholic baptism, considering themselves the true church. They assumed the name of *Cathari*, 'the Pure,' on the strength of their severity of discipline. In other respects than those mentioned the Novatians differed very little from the Catholics; and they were generally received back into communion on comparatively favorable terms. The sect continued to the sixth century. See *Sabbatian*.

3. In *law*, the substitution of a new obligation for an old one, usually by the substitution of a new debtor or of a new creditor. The term, however, is sometimes used of the substitution of a new obligation between the original parties, as the substitution of a bill of exchange for a right of action arising out of a contract of sale, though this is more commonly called *merger* or *extinguishment*. While in an *assignment* the old claim merely passes into other hands, in a *novation* there is a new claim substituted for it. The term is derived from the Roman law, where it was of great importance, because assignment of claims did not exist. It is possible by one *novation* to extinguish several obligations: as, if A owes a debt to B, B to C, and C to D, and it is agreed that A shall pay D in satisfaction of all, this promise, if consented to by all parties, extinguishes all the other claims, even though not performed.

novator† (nō-vā'tor), *n.* [= F. *novateur* = Sp. Pg. *novador* = It. *novatore*, < L. *novator*, < *novare*, pp. *novatus*, renew: see *novation*.] An innovator. *Bailey*, 1731.

3. In *civil law*, a new or supplemental constitution or decree; one of the novel constitutions of certain Roman emperors, so called because they appeared after the authentic publications of law made by these emperors. Those of Justinian (A. D. 527–65) are the best-known, and are commonly understood when the term is used. The *Novels*, together with the *Institute*, *Code*, and *Digest*, form the body of law which passes under the name of Justinian. Also *novella*.

By the civil law, no one was to be ordained a presbyter till he was thirty-five years of age; though by a later *novel* it was sufficient if he was above thirty. *Ayliffe.*

4. A fictitious prose narrative or tale, involving some plot of more or less intricacy, and aiming to present a picture of real life in the historical period and society to which the persons, manners, and modes of speech, as well as the scenery and surroundings, are supposed to belong. Its method is dramatic, and the novel may be regarded as a narrative play to the extent that the various persons or characters, upon whose qualities and actions the development and consummation of the plot or motive depend, are brought upon the scene to play their several parts according to their different personalities, disclosing, with the aid of the author's delineation and analysis, diverse aspects of passion and purpose, and contributing their various parts to the machinery of the drama to be enacted among them. The novel may be regarded as representing the third stage of transition in the evolution of fictitious narrative, of which the epic was the first and the romance the second. The novel in its most recent form may be divided, according to its dominant theme or motive, into the philosophical, the political, the historical, the descriptive, the social, and the sentimental novel; to which may be added, as special forms, the novel of adventure, the novel of society, the novel of character, the novel of criticism and satire, the novel of reform, and the military, the nautical, and the sporting novel.

Dime novel. See *dime*.—**Novels** (or **Novellæ**) **of Justinian.** See def. 3.—**Syn. 4.** *Tale*, *Romance*, *Novel*. *Tale* was at one time a favorite word for what would now be called a *novel*, as the *tales* of Miss Austen, and it is still used for a fiction whose chief interest lies in its events, as Marryat's sea *tales*. "Works of fiction may be divided into *romances* and *novels*. . . . The *romance* chooses the characters from remote, unfamiliar quarters, gives them a fanciful elevation in power and prowess, surrounds them by novel circumstances, verges on the supernatural or passes its limits, and makes much of fictitious sentiments, such as those which characterized chivalry. The poor sensational *novel* has points of close union with the earlier *romance*. . . . The *novel*, so far as it adheres to truth, and treats of life broadly, descending to the lowest in grade, deeply and with spiritual forecast, seeing to the bottom, is not only not open to these objections, but rather calls for . . . commendation." =**Syn. 1.** *Noxious, Pernicious, Noisome*, pestiferous, pestilent, poisonous, mischievous, corrupting. That which is *noxious* is actively and energetically harmful. That which is *pernicious* is as actively destructive. *Noisome* and *noxious* were once essentially the same (see Job xxxi. 40, margin; Ps. xci. 3; Ezek. xiv. 21), but *noisome* now suggests primarily foulness of odor, with a secondary *noxiousness* to health. Unwholesome vapors that do not offend the sense of smell would now hardly be called *noisome*.

Winds from all quarters agitate the air,
And fit the limpid element for use,
Else *noxious*. *Cowper*, Task, i.

(*a*) In De Blainville's classification (1824), the last one of five orders of the second section of his *Paracephalophora monoica*, divided into two families, *Nectopoda* and *Pteropoda*. The term is generally held to be a synonym of *Heteropoda*, but it is partly a synonym of *Pteropoda*, and these two groups are not exactly distinguished in the two families into which the author divides his nucleobranchs. Moreover, the order does not contain the genus *Cavolinia*, which is pteropodous, and does contain the genus *Argonauta*, which is cephalopodous. It therefore corresponds to no natural group, and is disused. See *Nectopoda* and *Heteropoda*. (*b*) By some recent conchologists used as a substitute for *Heteropoda*.

In *zoöl.*, the nucleus of a nucleus; one of the rounded deeply staining structures found in the nucleus of a cell. The relation they bear to the nuclear network is still uncertain. Some consider them as distinct from the nuclear network (Flemming); others consider them as merely thickened knots of

the network (Klein). The nucleolus of the human ovum was discovered by Wagner in 1836, and hence is sometimes called the *spot of Wagner* in anatomical text-books. See cut under *cell*, 5.

A large, clear, spherical nucleus is seen in the interior of the nerve-cell; and in the centre of this is a well-defined small round particle, the *nucleolus*.

Huxley, Crayfish, p. 187.

2†. Specifically, in *Infusoria*, a minute particle attached to the exterior of the nucleus (or "ovary"), formerly supposed to function as a testicle. But since it is the essential characteristic of a nucleolus to be contained within a nucleus, these so-called nucleoli of protozoans are now differently interpreted, and called *paranuclei*. See *paranucleus*.

3. In *bot.*, a small solid rounded granule or particle in the interior of the nucleus. There may be several nucleoli in each nucleus.

nucleoplasm (nū′klē-ō-plazm), *n.* [< L. *nucleus*, a kernel, + NL. *plasma* = E. *plasm*.] The more fluid part of the nucleus, found between the nuclear threads. See *nucleus*, 1 (*a*).

Not related to E. *nut*.] 1. A kernel; hence, a central mass about which matter is collected, or to which accretion is made; any body or thing that serves as a center of aggregation or assemblage; figuratively, something existing as an initial or focal point or aggregate: as, a *nucleus* of truth; a *nucleus* of civilization.

Then, such stories get to be true in a certain sense, and indeed in that sense may be called true throughout; for the very *nucleus*, the fiction in them, seems to have come out of the heart of man in a way that cannot be imitated of malice. *Hawthorne*, Septimius Felton, p. 111.

The regiments fashioned by his [Cromwell's] master hand, steady, perfectly ordered, and enthusiastic in their cause, became the *nucleus* of the far-famed Ironsides. *Edinburgh Rev.*, CLXV. 465.

(*a*) In *biol.*, the kernel of a cell, in general; a central or interior differentiated mass of protoplasm, found in nearly all cells, vegetable or animal, and consisting of an elliptical or spherical body composed of (1) a nuclear membrane, (2) nuclear network, and (3) nuclear sap, and containing nucleoli. The nuclear network is made up of threads or fibrils which are composed of a deeply staining part, "chromatin," and a feebly staining intermediate substance, "linin" or parachromatin (nucleohyaloplasm). In the meshes of the network is found the more fluid part of the nucleus, the nuclear sap (karyolymph, karyochylema, paralinin). Nucleoplasm, according to Carnoy, consists of a plastin network and a granular fluid, "enchylema." The nuclear membrane is considered by some observers to be an inner limiting layer of cell-protoplasm surrounding the nucleus, by others to be a condensation of the peripheral portion of the nuclear network. There may be but one nucleus or several nuclei in one cell; and a nucleus may be nucleolate or not. Nuclei are generally proportionate in size to the cell containing them; in some instances, however, they form almost the entire cell-mass. A structural difference between the nucleus and the rest of the cell-protoplasm is indicated by its greater resistance to powerful reagents, and by its varied reaction with stains. Functionally, the nucleus is the most important portion of the cell, as it is here that the complex series of changes known as karyokinesis takes place, resulting in the division of the nucleus and followed by the division of the cell. This process of mitotic or indirect cell-division is found in nearly all cells, whether vegetable or animal, fetal or adult, normal or pathological. Instances of cell-division not mitotic have, however, been noted. The nucleus of the human ovum was discovered by Purkinje in 1825, and hence is often called the *corpuscle of Purkinje*. Its usual name in text-books of anatomy is *germinal vesicle*. See cut under *cell*, 5. 5. In *law*, such a use of property or such a course of conduct as, irrespective of actual trespass against others or of malicious or actual criminal intent, transgresses the just restrictions upon use or conduct which the proximity of other persons or property in civilized communities imposes upon what would otherwise be rightful freedom. Thus, the use of steam-power, though on one's own premises and for a lawful purpose, may be a nuisance, if by reason of being in one of several closely built dwellings the vibration and noise cause unreasonable injury to the adjacent property and occupants. Any serious obstruction to a highway or navigable river if not authorized by law is a nuisance; but the temporary use of a reasonable part of a highway for a legitimate purpose, such as the moving of a building or the deposit of building materials going into use, is not necessarily a nuisance. The question of nuisance always is, at what point the selfish use of a right transcends the obligation to respect the welfare of others. A *common nuisance*, or *public nuisance*, is one which tends to the annoyance of the public generally, and is therefore to be redressed by forcible abatement or by an action by the state, as distinguished from a *private nuisance*, or one which causes special injury to one or more individuals and therefore will sustain a private action. Thus, if one obstructs a highway any person may remove the obstruction, but only the public can prosecute the offender, unless a particular individual suffers special injury, as where he is turned from his road and compelled to go another way and suffers thereby a specific pecuniary damage, in which case it is as to him a private nuisance, and he may sue.

This brings the knife *g* into action, and by moving the carriage longitudinally the stick is turned round. Nummulites comprise a great variety of fossil foraminifers having externally somewhat the appearance of a piece of money (hence their name), without any apparent opening, and internally a spiral cavity, divided by partitions into numerous chambers, communicating with each other by means of small openings. The thickness of the group is also variable, reaching in places several thousand feet. 2. In *pathol.*, a constant nodding or involuntary shaking of the head. *Dunglison.*—3. In *astron.*, a small subordinate gyratory movement of the earth's axis, in virtue of which, if it subsisted alone, the pole would describe among the stars, in a period of about nineteen years, a minute ellipse, having its longer axis directed toward the pole of the ecliptic, and the shorter, of course, at right angles to it. The consequence of this real motion of the pole is an apparent approach and recession of all the stars in the heavens to the pole in the same period; and the same cause will give rise to a small alternate advance and recession of the equinoctial points, by which both the longitudes and the right ascensions of the stars will be also alternately increased or diminished. This nutation, however, is combined with another motion—namely, the precession of the equinoxes—and in virtue of the two motions the path which the pole describes is neither an ellipse nor a circle, but a gently undulated ring; and these undulations constitute each of them a nutation of the earth's axis. Both these motions and their combined effect arise from the same physical cause—namely, the action of the sun and moon upon the protuberant mass at the earth's equator. See *precession*.

The phenomena of Precession and *Nutation* result from the earth s being not centrobaric, and therefore attracting the sun and moon, and experiencing reactions from them, in lines which do not pass precisely through the earth's centre of inertia, except when they are in the plane of its equator. *Thomson and Tait*, Nat. Phil., § 825.

4. In *bot.*, a side-to-side motion in growth.

★ **1.** The fifteenth letter and fourth vowel in our alphabet. It followed *N* also in the Italian systems, but was separated from it in Greek and Phenician by another character, which in the latter had the value of a sibilant, and in the former that of the compound *ks* (ξ). The O-character, accordingly, was the sixteenth in the Phenician alphabet, and it represented there the *ain*, a very peculiar and to us unpronounceable guttural; the Greeks (as in the case of E: see that letter) arbitrarily changed its value to that of a vowel, corresponding in quality to our "long *ō*." There is no traceable Egyptian prototype for the character; the comparison of older forms is therefore as follows:

Egyptian. Hieroglyphic. Hieratic. — Phenician. — Early Greek and Latin.

It thus appears that the belief, not uncommonly held, that O represents, and is imitated from, the rounded position of the lips in its utterance, is a delusion. The historical value of the letter (as already noticed) is that of our *o*, in *note*, etc., whether of both long and short quantities, as in Latin and the earliest Greek, or of short only, as in Greek after the addition to that alphabet of a special sign for long ɒ (namely *omega*, Ω, ω). This vowel-sound, the name-sound of *o*, is found in English usage only with long quantity in accented syllables. There is no closely corresponding short vowel in standard English, but only in dialectal pronunciation, as in the New England utterance of certain words (much varying in number in different individuals): for example, *home*, *whole*, *none*. What we call "short *o*" (in *not*, *on*, etc.) is a sound of altogether different quality, very near to a true short *ä* (that is, a short utterance corresponding to the *a* of *arm*, *father*), but verging slightly toward the "broad" *a* (*ȧ*) or *o* (*ȯ*) of *laud*, *lord*. "Short *o*" has a marked tendency to take on a "broader" sound, especially before *r*, and especially in America: hence the use, in the respellings of this work, of *ȯ*, which varies in different mouths from the full sound of *ȧ* to that of *ō*. After these three values of the character, the next most common one is that of the *oo*-sound, the original and proper sound of *u* (represented in this work by *ö*), as in *move*, with the nearly corresponding short sound (marked *u̇*) in a few words, as *wolf*, *woman*. All these vowel-sounds partake of what is usually called a "labial" or a "rounded" character: that is to say, there is involved in their utterance a rounding and closing movement of the lips (and, it is held, of the whole mouth-cavity), in different degrees—least of all in *ŏ*, more and more in *ȧ*, *ō*, *u̇*, *ö*; in the last, carried to its extreme, no closer rounding and approximation being possible. The labial action helps to give the vowel-sounds in question their fully distinctive character; but it can be more or less slighted without leaving them unrecognizable, and, in the generally indifferent habit of English pronunciation, is in a degree neglected, even in accented syllables, and yet more in unaccented. Our "long *ō*," it should be added, regularly ends with a vanishing sound of *oo* (*ö*), as our *ā* with one of *ē*. *O* also has in many words the value of the "neutral" vowels of *hut*, *hurt*: for example, in *son*, *come*, *love*, *work*. *O* is further a member of several very common and important digraphs: thus, *oo*, the most marked representative of the *ö*-sound (in *moon*, *rood*, etc.), but also pronounced as *u̇* (*book*, *look*, etc.) and *ŭ* (*blood*, etc.); *ou* (in certain situations *ow*), oftenest representing a real diphthong (in *out*, *sound*, *now*, etc.), but also a variety of other sounds (as in *through*, *could*, *ought*, *rough*); *oi* (in certain situations *oy*), standing for a real diphthongal sound of which the first element is the "broad" *o*- or *a*-sound (for example, *point*, *boy*); *oa* (*load*, etc.), having the "long" *o*-sound; others, as *eo* (variously pronounced, as in *people*, *yeoman*, *jeopard*), *oe* (in *foe*, *does*, etc.), are comparatively rare.

In its nobler representatives the oak as "the monarch of the forest" has always been impressive, and it anciently held an important place in religious and civil ceremonies. Oak chaplets were a reward of civic merit among the Romans; the Druids venerated the oak as well as the mistletoe which grows upon it. The timber of many species is of great economic value, and the bark of several is used for tanning and dyeing and in medicine. (See *oak-bark* and *quercitron*.) One species furnishes cork (see *cork*[1]). The fruit-cups of some are used in tanning (see *valonia*). (See also *gall*[3], *kermes*, and *kermes-oak*.) The species is distributed throughout a great part of Europe and in western Asia. It attains great age, with an extreme height of 120 feet. For ship-building its timber is considered invaluable, having the requisite toughness and most other qualities without extreme weight, and until recently it was the prevailing material of British shipping. In the eastern half of North America the white oak, *Q. alba*, in England sometimes called *Quebec oak*, occupies a somewhat similar but less commanding position. It rises from 70 to 140 feet, and affords a hard, tough, and durable wood, used, though not equal to the English oak, in ship-building, construction of all sorts, the manufacture of carriages and implements, cabinet-making, etc. The bur, overcup, or mossy-cup oak, *Q. macrocarpa*, is a tree of similar range, equal size, and even superior wood, which is not always distinguished from that of the white oak.

toward the tropics, yet not ripening quite as far north as barley. Oats are grown chiefly as food for beasts, especially horses, being most largely so used in the United States: but they also form an important human food (especially in Scotland, of late years somewhat in the United States), in point of nutrition ranked higher by some than ordinary grades of wheat flour. (See *oatmeal, groats,* and *sowens.*) All the varieties of the ordinary cultivated oat are referred to *A. sativa*, but this is believed by many to be derived from the wild oat, *A. fatua.* The race called *naked oat*, sometimes regarded as a species, *A. nuda*, differs from other sorts in having the seed free from the glume. It is successful in Ireland, etc., but not in America. A variety well approved in both hemispheres is the potato-oat, with a large white plump grain, the original of which was found growing accidentally with potatoes. The black Poland is another esteemed variety; the Tartarian and the Siberian are recommended for poor soils. The varieties are numerous, new ones constantly appearing.

(*b*) Any species of *Avena.* The wild oat of Europe, *A. fatua*, is a weed of cultivation in many places; in California, where it abounds, it is extensively utilized as hay. The animal, fly, or hygrometric oat, *A. sterilis*, native in Barbary, has two long, strong, much-bent awns, which twist and untwist with changes of moisture, and so become a means of locomotion. Various species are more or less available for pasture.

The apex in the typical obelisks of ancient Egypt was sheathed with a bronze cap. The proportion of the thickness to the height is nearly the same in all Egyptian obelisks — that is, between one ninth and one tenth; and the thickness at the top is never less than half nor greater than three fourths of the thickness at the base. Egypt abounded with obelisks, which were set up to record the honors or triumphs of the kings; and many have been removed thence, in both ancient and modern times. Two of the largest of them, about 78 feet in height, which had been erected by Sesostris in Heliopolis, were removed to Rome by Augustus. Two obelisks in Alexandria, known as Cleopatra's Needles, were offered by Mehemet Ali to Great Britain and France respectively. The French chose instead the Luxor obelisk, which was erected in the Place de la Concorde in Paris in 1833. That chosen by the British lay prostrate in the sand until it was removed and erected on the Thames embankment in London, in 1878, by private enterprise. Its height is 68 feet 5½ inches, and its dimensions at the base are 7 feet 10½ inches by 7 feet 5 inches. The companion obelisk was afterward presented to the city of New York, where it now stands in Central Park, having been transported thither in 1880 by private enterprise.

Things suffer in general; the slaves run away or are inclined to be turbulent; he [the bad head driver] and they cabal; bad sugar is made; and perhaps the horrid and abominable practice of *Obea* is carried on, dismembering and disabling one another; even aiming at the existence of the white people.

object (ob′jekt), *n.* [= F. *objet* = Sp. *objeto* = Pg. *objecto* = It. *obbietto*, *objetto*, *oggetto* = D. G. Dan. Sw. *objekt*, < (*a*) L. *objectum*, a charge, accusation, ML. an object, neut. of *objectus*, pp.; (*b*) L. *objectus*, a casting before, also that which presents itself to the sight, an object; < L. *objectus*, pp. of *objicere*, *obicere*, throw before, cast before, present: see *object*, *v.*] 1. Anything which is perceived, known, thought of, or signified; that toward which a cognitive act is directed; the non-ego considered as the correlate of a knowing ego. By the *object* may be meant either a mere aspect of the modification of consciousness, or the real external thing (whether mediately or immediately perceived) which affects the senses. Opposed to *subject*. [*Objectum* in this sense came into use early in the thirteenth century. It is remarkable as not being a translation of a Greek word.]

As Chameleons vary with their *obiect*,
So Princes manners do transform the Subiect.
Sylvester, tr. of Du Bartas's Weeks, i. 2.

His mind is not much distracted with *objects;* but if a goode fat Cowe come in his way, he stands dumbe and astonisht, and, though his haste bee neuer so great, will fixe here halfe an houres contemplation.

W. K. Clifford, Lectures, II. 70.

2. That toward which an action is directed and which is affected by it; that concerning which an emotion or passion is excited. The correlates of actions, of approach, recession, attraction, repulsion, attack, and the like are termed *objects:* as, the *object* shot at.

Those things in ourselves are the only proper *objects* of our zeal which, in others, are the unquestionable subjects of our praises. *Bp. Sprat.*

J. Sully, Outlines of Psychol., p. 582.

3. An idea to the realization of which action is directed; purpose; aim; end.

Howell, Letters, ii. 67.

Education has for its *object* the formation of character.
H. Spencer, Social Statics, p. 201.

The first *object* of the true politician, as of the true patriot, is to keep himself and his party true, and then to look for success; to keep himself and his party pure, and then to secure victory.
Stubbs, Medieval and Modern Hist., p. 20.

4. A thing, especially a thing external to the mind, but spoken of absolutely and not as relative to a subject or to any action.

Some rare note-worthy *object* in thy travels.
Shak., T. G. of V., i. 1. 13.

Bentham, Introd. to Morals and Legislation, xvi, 1, note.

5. In *gram.*: (*a*) A member of the sentence, a substantive word or phrase or clause, immediately (that is, without the intervention of a preposition) dependent on a verb, as expressing that on which the action expressed by the verb is exerted. The object of a verb is either *direct* or *indirect*. A direct object receives the direct action of the verb, and is in the accusative or objective case, so far as there is a distinctive form for that case, and a verb admitting such an object is called *transitive:* as, he saw *me;* they gave a *book;* an indirect object represents something (usually) to or for which the action is performed, and so is in the dative case, so far as that case is distinguished (as only imperfectly in English): thus, they gave *her* a book; I made the *boy* a coat; but in some languages indirect objects of other cases occur. A direct object which repeats in noun form an idea involved in the verb is called a *cognate* object: as, I dreamed a *dream;* they run a *race*. The name *factitive object* is often given to an objective predicate. See *predicate*. (*b*) A similar member of the sentence dependent on a preposition, i. e. joined by a preposition to the word it limits or qualifies: as, he went with *me;* a man of *spirit*. Such an object is in English always in the accusative or objective case; in other languages often in other cases, as genitive, dative, ablative. The object, whether of a verb or of a preposition, is said to be *governed* — that is, required to be of a particular case — by the verb or preposition.

6†. The aspect in which a thing is presented to notice; sight; appearance. [Rare.]

He, advancing close
Up to the lake, past all the rest, arose
In glorious *object*. *Chapman.*

The *object* of our misery is as an inventory to particularize their abundance. *Shak.*, Cor., i. 1. 21.

7. A deformed person, or one helpless from bodily infirmity; a gazing-stock. [Colloq.]

8†. An obstacle. [Rare.]

To him that putteth not an *object* or let (I use the schoolmen's words) — that is to say, to him that hath no actual purpose of deadly sin, [the sacraments] give grace, righteousness, forgiveness of sins.
Becon, Works, III. 380. (*Davies.*)

Egoistical, exterior, external, first, formal, material, mediate, etc., **object.** See the adjectives.

objectable (ob-jek′ta-bl), *a.* [< OF. *objectable;* as *object*, *v.*, + *-able*.] Capable of being made or urged as an objection. [Rare.]

It is as *objectable* against all those things which either native beauty or art affords.
Jer. Taylor (?), Artif. Handsomeness, p. 145.

objectation (ob-jek-tā′shon), *n.* [< L. *objectatio(n-)*, a reproach, < *objectare*, reproach: see *object*.] Reproach or cavil; captious objection.

All the knotty questions of the realm are referred to us, and, when they are discussed in the common hearing, each of us, without strife or *objectation*, sharpens his wits to speak well upon them.
Peter of Blois (trans.), in Stubbs's Medieval and Modern [Hist., p. 143.

object-finder (ob′jekt-fīn″dėr), *n.* In microscopes, a device to enable the observer to fix the position of an object in the slide under examination, so that he can find it again at will. It is especially necessary when high powers are employed. Various forms of finders have been devised; one of the most common involves the use of a slide with horizontal and vertical scales, adjusted in connection with the mechanical stage.

object-glass (ob′jekt-glȧs), *n.* In a telescope or microscope, the lens which first receives the rays of light coming directly from the object, and collects them into a focus, where they form an image which is viewed through the eyepiece. In the finest refracting telescopes the object-glass consists of an achromatic combination of lenses, formed of substances having different dispersive powers, and of such figures that the aberration of the one may be corrected by that of the other. Ordinarily the combination consists of a convex lens of crown-glass and a concave lens of flint-glass, having focal lengths proportional to their dispersive powers. There are many different forms which fulfil the condition indicated, but vary in the curves of the lenses, their thickness, their relative position, and the distance between them. With the ordinary crown- and flint-glass it is not possible to obtain perfect achromatism; with the new kinds of glass made at Jena a much more perfect correction is possible, and it is likely that as a result telescopes will soon be greatly improved, provided the glass can be made in pieces of sufficient size and satisfactorily homogeneous. See *objective*, *n.*, 3, and cuts under *microscope*.

objectification (ob-jek″ti-fi-kā′shon), *n.* [< *objectify* + *-ation* (see *-fication*).] The act or process of objectifying or of making objective. Also *objectivation*.

The diminution or increase of that which is perceived (of course, unreflectingly) as the area of self-assertion, or (if we like the phrase) as "the *objectification* of the will," is essentially and immediately connected with our own discomfort or pleasure.
F. H. Bradley, Ethical Studies, p. 254.

objectify (ob-jek′ti-fī), *v. t.*; pret. and pp. *objectified*, ppr. *objectifying*. [< ML. *objectum*, an object, + L. *-ficare*, make: see *object* and *-fy*.] To make objective; present as an object; especially, to constitute as an object of sense; give form and shape to as an external object; externalize. Also *objectivate*, *objectize*.

Because it [mind] is bound to think a coexistence or sequence, it *objectifies* the necessity.
Maudsley, Body and Will, p. 127.

T. H. Green, Prolegomena to Ethics, § 12.

What we start with in the child is the feeling of himself affirmed or negated in this or that sensation; and the next step . . . is that the content of these feelings is *objectified* in things. *F. H. Bradley*, Ethical Studies, p. 251.

objection (ob-jek′shon), *n.* [= F. *objection* = Sp. *objecion* = Pg. *objecção* = It. *obbiezione*, *objezione*, < LL. *objectio(n-)*, a throwing or putting before, a reproaching, ML. an objection, < L. *objicere*, *obicere*, pp. *objectus*, throw before, object: see *object*, *v.*] 1. 2. That which is interposed or presented in opposition; an adverse contention, whether by or without stating the opinion, reason, or argument on which it is founded: as, many *objections* to that course were urged; the *objections* of the defendant were overruled.

As for your spiteful false *objections*,
Prove them, and I lie open to the law.

I. *a.* 1†. As perceived or thought; intentional; ideal; representative; phenomenal: opposed to *subjective* or *formal*—that is, as in its own nature. [This, the original meaning which the Latin word received from Duns Scotus, about 1300, almost the precise contrary of that now most usual, continued the only one till the middle of the seventeenth century, and was the most familiar in English until the latter part of the eighteenth.]

Natural phenomena are only natural appearances. They are, therefore, such as we see and perceive them. Their real and *objective* natures are therefore the same.
Berkeley.

The faculty of the imagination, for example, and its acts were said to have a subjective existence in the mind; while its several images or representations had, qua images or objects of consciousness, only an *objective.* Again, a material thing, say a horse, qua existing, was said to have a subjective being out of the mind; qua conceived or known, it was said to have an *objective* being in the mind.
Sir W. Hamilton, in Reid's Supplementary Dissertations, [note B., § 1.

Where or when should we be ever able to search out all the vast treasuries of *objective* knowledge that layes within the compass of the universe?
Sir M. Hale, Orig. of Mankind, p. 156.

[By *objective* knowledge was meant the propositions known, opposed to *formal* or *subjective* knowledge, the act or habit of knowing. Such expressions probably led to the change of meaning of the word.]

2. Pertaining or due to the real object of cognition; real: opposed to *subjective* (pertaining or due to the subject of cognition, namely, the mind). [This meaning of the word nearly reverses the original usage; yet if such passages as that from Sir M. Hale, above, on the one hand, and that from Watts, below, on the other, be compared, the transition will be seen to have been easy. Kant makes the objects of experience to be at once real and phenomenal; and what he generally means by the *objective* character of a proposition is the force which it derives from the thing itself compelling the mind, after examination, to accept it. But occasionally Kant uses *objective* to imply a reference to the unknowable thing-in-itself to which the compelling force of phenomena is due.]

Objective certainty is when the proposition is certainly true in itself; and subjective when we are certain of the truth of it. The one is in things, the other is in our minds.
Watts, Logic, ii. 2. § 8.

[Thus, there is an *objective* certainty in things that any given man will die; and a *subjective* certainty in his mind of that *objective* certainty.]

Objective means that which belongs to, or proceeds from, the object known, and not from the subject knowing, and thus denotes what is real, in opposition to what is ideal—what exists in nature, in contrast to what exists merely in the thought of the individual.
Sir W. Hamilton, Metaph., ix.

A form of consciousness, which we cannot explain as of natural origin, is necessary to our conceiving an order of nature, an *objective* world of fact from which illusion may be distinguished.
T. H. Green, Prolegomena to Ethics, § 19.

If an exact *objective* measurement of the physical stimuli is intrinsically difficult, an exact subjective measurement of the sensations themselves is inherently impossible.
G. T. Ladd, Physiol. Psychology, p. 361.

The number of vibrations is the *objective* characteristic of that which we perceive subjectively as colour.
Lommel, Light (trans.), p. 226.

3. Substantive; self-existent. [This rather confusing use of the word belongs to writers of strong nominalistic tendencies.]

Science . . . agrees with common sense in demanding a belief in real *objective* bodies, really known as causes of the various phenomena the laws and interrelations of which it investigates.
Mivart, Nature and Thought, p. 89.

The only other thing in the physical universe which is conserved in the same sense as matter is conserved, is energy. Hence we naturally consider energy as the other *objective* reality in the physical universe.
Tait, in Encyc. Brit., XV. 747.

4. Intent, as a person, upon external objects of thought, whether things or persons, and not watching one's self and one's ways, nor attending to one's own sensations; setting forth, as a writing or work of art, external facts or imaginations of such matters as they exist or are supposed to exist, without drawing attention to the author's emotions, reflections, and personality.

The only healthful activity of the mind is an *objective* activity, in which there is as little brooding over self as possible.
J. Fiske, Cosmic Philos., I. 142.

The two epics [the Iliad and Odyssey] appear on the horizon of time so purely *objective* that they seem projected into this visible diurnal sphere with hardly a subjective trace adhering to them, and are silent as the stars concerning their own genesis and mutual relation.
W. D. Geddes, Problem of the Homeric Poems, ii.

The theme of his [Dante's] poem is purely subjective, modern, what is called romantic; but its treatment is *objective* (almost to realism, here and there), and it is limited by a form of classic severity.
Lowell, Among my Books, 2d ser., p. 37.

5. In *gram.*, pertaining to or noting the object of a transitive verb, or of a preposition; forming or expressing a grammatical object: as, the *objective* case; an *objective* phrase or clause. Abbreviated *obj.*—**Objective abstraction, beatitude, being, doubt.** See the nouns.—**Objective cause,** the external object which excites the principal cause of any effect to action; the procatarctical cause.—**Objective concept,** a concept conceived as constituting a real likeness among the objects which come under it: opposed to a *formal concept*, or the concept regarded merely as a function of thought.—**Objective end, ens, evidence, idealism,** etc. See the nouns.—**Objective line,** in *persp.*, any line drawn on the geometrical plane the representation of which is sought in the draft or picture.—**Objective logic,** the logic of objective thought; the general account of the process by which the interaction of ideal elements constitutes the world. *Hegel.*—**Objective method,** the inductive method: the method of modern science.—**Objective philosophy.** Same as *transcendental philosophy* (which see, under *philosophy*).—**Objective plane,** any plane, situated in the horizontal plane, whose perspective representation is required.—**Objective point.** (*a*) The point or locality aimed at; the final or ultimate point to which or to reach which one's efforts or desires are directed; specifically (*milit.*), the point toward securing which a general directs his operations, expecting thereby to obtain some decisive result or advantage. Hence—(*b*) The ultimate end or aim; that toward the attainment of which effort, strategy, etc., are directed.—**Objective power** or **potency,** that of a consistent object of thought; logical possibility; non-existence combined with non-repugnance to existence.—**Objective reality,** the reference of a concept to an object.—**Objective reason** or **thought,** in *metaph.*, reason or thought as existing not in the individual mind, but as in the real objects of cognition.

A truly *objective thought*, far from being merely ours, must at the same time be what we have to discover in things, and in every object of perception.
Hegel, tr. by Wallace, Logic of the Encyclopedia, § 41.

Objective symptoms, in *med.*, symptoms which can be observed by the physician, as distinct from *subjective symptoms*, such as pain, which can be directly observed only by the patient.—**Objective truth,** the agreement of a judgment with reality; material truth.—**Objective validity,** applicability to the matter of sensation.

There therefore arises here a difficulty which we did not meet with in the field of sensibility, namely how subjective conditions of thought can have *objective validity*—that is, become conditions of the possibility of the knowledge of objects.
Kant, Critique of Pure Reason (tr. by Max Müller, orig. [ed.), p. 89.

II. *n.* 1. In *Eng. gram.*, the objective case; the case used to express the object of a verb or a preposition. This case answers in most of its uses to the accusative of Greek, Latin, German, and other languages, and is sometimes so called in English. In nouns it is never distinct in form from the subjective or nominative; the only objectives having such a distinct form are the pronominal case-forms *me, thee, him, her, us, them, whom*, corresponding to the nominatives *I, thou, he, she, we, they, who* respectively. Of these, *her* happens to be the same in form as the possessive. When words expressing extent in space or duration in time are put in the objective, they are called *adverbial objectives:* as, he ran a *mile;* she sang an *hour.* Compare *cognate object*, under *object*, 5. Abbreviated *obj.*

2. An objective point; especially, the object, point, or place to or toward which a military force is directing its march or its operations.

In 1864 the main *objectives* were Lee's and Johnston's armies, and the critical point was thought to be Richmond or Atlanta, whichever should be longest held.
The Century, XXXV. 595.

3. The lens, or practically the combination of lenses, which forms the object-glass of an optical instrument, more particularly of the microscope (see *object-glass*). Microscope objectives are generally named from the focal length of a single lens which would have the same magnifying power. Telescope objectives are named from their diameters. Objectives of high magnifying power and consequently of short nominal focal length (*e. g.*, less than one half an inch) are often spoken of as *high powers*, in distinction from the *low powers*, which magnify less and have longer nominal focal lengths. Objectives are also characterized as *immersion-objectives* or *dry objectives* according as they are used with or without a drop of liquid between the lens and the object; if the liquid has sensibly the same refractive power as the glass of the lens, the system is called *homogeneous immersion.* (See *immersion*, 5.) The properties of an objective which determine its value for practical work are—*definition* or defining power, depending upon its freedom from spherical and chromatic aberration, which should be accompanied by flatness of field; *penetration*, the power of bringing parts of the object at different levels into focus at once; *resolving power*, the ability (depending upon the size of the aperture and the definition) to exhibit the minute details of structure, as the lines on a diatom frustule (see *test-object*); *working distance*, which is the space separating the lens and the object when the latter is in focus. These properties are in some degree antagonistic: thus, an increase in the aperture, and hence of the resolving power, is accompanied by a decrease in the working distance. The aperture of an objective is often measured by the angle of the cone of rays which it admits, and is then called *angular aperture.* Since, however, this angle varies according as it is used as a dry, water-immersion, or homogeneous-immersion objective, a common measure is obtained, as proposed by Abbe, by taking the product of the half-angle into the refractive index of the medium employed; this is called the *numerical aperture* (sometimes written *N. A.*). Thus, for the maximum air-angle of 180°, which is equivalent to a water-angle of 97° 31′ and a balsam-angle of 82° 17′, the numerical aperture is unity, while for the respective angles of 60° (air), 44° 10′ (water), 38° 24′ (balsam), it is 0.5. Again, a numerical aperture of 1.33 corresponds to the maximum water-angle of 180° and a balsam-angle of 122° 6′. —**Endomersion-objective,** a form of objective, or object-glass, devised by Zeuger, in which the chromatic aberration is removed by the employment of a liquid (as a mixture of ethereal and fatty oils) placed between the separate lenses.

See *objective, a.*

The Greek philosophers alone found little want of a term precisely to express the abstract notion of *objectivity* in its indeterminate universality, which they could apply, as they required it, in any determinate relation.
Sir W. Hamilton (in Reid), Supplementary Dissertations, [note B, i.

Preponderant *objectivity* seems characteristic of the earlier stages of our consciousness, and the subjective attitude does not become habitual till later in life.
H. Sidgwick, Methods of Ethics, p. 41.

The secret of the *objectivity* of phenomena, and their connection as parts of one world, must obviously be sought, not without but within, not in what is simply given to the mind but in what is produced by it.
E. Caird, Philos. of Kant, p. 198.

Intense *objectivity* of regards, as in a race or an engrossing operation, is not, strictly speaking, unconsciousness, but it is the maximum of energy with the minimum of consciousness.
A. Bain, Mind, XII. 578.

object-soul (ob'jekt-sōl), *n.* In *anthropology*, a soul or vital principle believed by many barbarous tribes to animate lifeless objects, and generally imagined as of a phantom-like, attenuated materiality, rather than as of a purely spiritual character.

The doctrine of *object-souls*, expanding into the general doctrine of spirits conveying influence through material objects, becomes the origin of Fetichism and idolatry.
Encyc. Brit., II. 56.

In the Anglican Church the use of leavened bread in loaves of ordinary size and form was permitted at the Reformation, and became the prevalent though not exclusive use. The Greek Church uses a circular oblate of leavened bread, in the center of which is a square projection called the *Holy Lamb*. The act of offering. Specifically, *eccles.*: (*a*) The donation by the laity of bread and wine for the eucharist, and of other gifts or of contributions in money for the maintenance of divine worship and for the support of the clergy and the poor. In the early church the bread and wine were given by members of the congregation to the deacon before the liturgy, and offered by the priest on the altar; later this custom fell into disuse, and the other gifts were presented at or just before the offertory. The Greek church has a special preparation of the elements in the office of prothesis (see *prothesis*), before the liturgy. (*b*) The offering or presenting to God upon the altar of the unconsecrated bread and wine; the offertory. (*c*) The solemn offering or presentation in memorial before God of the consecrated elements as sacramentally the body and blood of Christ. This is called the *great oblation*, in distinction from the *lesser oblation* or offertory. The great oblation forms the second part of the prayer of consecration, the first part being the words of institution, or the consecration in the stricter sense. In the Oriental liturgies, in the Scotch communion office of 1764, and in the American Book of Common Prayer, the great oblation is succeeded by the invocation or epiclesis.

D. *hobo*, G. *hoboe*, E. *hoboe*, *hoboy*, directly from the F.), < It. *oboe*, < F. *hautbois*, hautboy: see *hautboy*.] 1. An important musical instrument of the wood wind group, and the type of the family in which the tone is produced by a double reed. In its modern form it consists of a wooden tube of conical bore, made of three joints, the lowest of which is slightly flaring or belled, while the uppermost carries in its end the metal staple with its reeds of cane. The number of finger-holes varies considerably; in the larger varieties they are principally controlled by an intricate system of levers. The extreme compass is nearly three octaves, upward from the B♭ or B♮ next below middle C, including all the semitones. The tone is small, but highly individual and penetrating; it is especially useful for pastoral effects, for plaintive and wailing phrases, and for giving a reedy quality to concerted passages. The normal key (tonality) of the orchestral oboe is C, and music for it is written with the G clef. The oboe has borne various names, such as *chalumeau, schalmey, shawm, bombardo piccolo, hautboy*, etc. It has been a regular constituent of the modern orchestra since early in the eighteenth century, and is the instrument usually chosen to give the pitch to others. It has also been used to some extent as a solo instrument. The oboe family of instruments includes the oboe d'amour, the oboe da caccia or tenoroon, the English horn, and the bassoon.

It differed from the modern oboe in being of lower pitch (the normal key being A), and in having a globular bell and thus a more somber and muffled tone.—**Oboe da caccia,** an obsolete tenor oboe, or rather tenor bassoon. Its normal key was F. The tone was similar to that of the bassoon, but lighter. Also called *tenoroon* and *fagottino*.

In those sciences which describe and explain provinces of the universe as it exists, such as astronomy and systematic biology, observations are, for the most part, made under circumstances or conditions which may be selected, but cannot be produced at will. But in those sciences which analyze the behavior of substances under various conditions it is customary first to place the object to be examined under artificially produced conditions, and then to make an observation upon it. This whole performance, of which the observation is a part, is called an *experiment*. Formerly sciences were divided into sciences of experiment and sciences of observation, meaning observation without experiment. But now experiments are made in all sciences. It is only occasionally that the word *observation* has been used to imply the absence of experimentation.

=Syn. 1. *Obstinate, Stubborn, Intractable, Refractory, Contumacious*, pertinacious, headstrong, unyielding, dogged, wilful, persistent, immovable, inflexible, firm, resolute. The first five words now imply a strong and vicious or disobedient refusal to yield, a resolute or unmanageable standing upon one's own will. *Stubborn* is strictly negative: a *stubborn* child will not listen to advice or commands, but perhaps has no definite purpose of his own. *Obstinate* is active: the *obstinate* man will carry out his intention in spite of advice, remonstrance, appeals, or force. The last three of the italicized words imply disobedience to proper authority. *Intractable*, literally not to be drawn, handled, or governed, is negative; so is *refractory*: both suggest sullenness or perverseness; *refractory* is more appropriate where resistance is physical: hence the extension of the word to apply to metals. *Contumacious* combines pride, haughtiness, or insolence with disobedience; in law it means wilfully disobedient to the orders of a court.

He was a great advocate of the rule of poverty of the Franciscan order, to which he belonged, and a strong defender of the state against the pretensions of the papacy. All his teachings depend upon the logical doctrine that generality belongs only to the significations of signs (such as words). The conceptions of the mind are, according to him, objects in themselves individual, but naturally significative of classes. These principles are carried into every department of logic, metaphysics, and theology, where their general result is that nothing can be discovered by reason, but all must rest upon faith. Occamism thus prepared the way for the overthrow of scholasticism, by arguing that little of importance to man could be learned by scholastic methods: yet the Occamistic writings exhibit the scholastic faults of triviality, prolixity, and formality in a higher degree than those of any other school.

This kind of *occision* of a man according to the laws of the kingdom, and in execution thereof, ought not to be numbered in the rank of crimes.
Sir M. Hale, Pleas of Crown, xlii.

occlude (o-klöd'), *v. t.*; pret. and pp. *occluded*, ppr. *occluding*. [< L. *occludere* (> F. *occlure*), shut up, close up, < *ob*, before, + *claudere*, shut, close: see *close*[1], and cf. *conclude*, *exclude*, *include*, etc.] 1. To shut up; close. [Rare.]

Ginger is the root . . . of an herbaceous plant . . . very common in many parts of India, growing either from root or seed, which in December and January they take up, and, gently dried, roll it up in earth; whereby, *occluding* the pores, they conserve the natural humidity, and so prevent corruption. *Sir T. Browne*, Vulg. Err., ii. 6.

2. In *physics* and *chem.*, to absorb: specifically applied to the absorption of a gas by a metal, such as iron, platinum, or palladium, particularly at a high temperature. Thus, palladium heated to redness and cooled in a current of hydrogen absorbs or *occludes* over 900 times its volume of the gas. By this means the physical properties of the metal are changed, such as its specific heat, specific gravity, and electrical conductivity. Probably a part of the gas forms a definite chemical compound with the metal. Occluded gases also occur in meteorites. Thus, the Arva meteoric iron yielded (Wright) 47 volumes of the mixed gases carbon dioxid, carbon monoxid, hydrogen, and nitrogen.

Very porous bodies . . . are able to *occlude* comparatively large quantities of some gases.
W. Watson, Text-book of Physics, p. 169.

Professor Graham has shown its [palladium's] remarkable power of absorbing hydrogen. When a strip of palladium is made the negative electrode in an apparatus for decomposing water, it absorbs 800 or 900 times its volume of hydrogen, expanding perceptibly during the absorption. This *occluded* gas is again given off when the substance, which Professor Graham believed to be an actual alloy of palladium and hydrogen, is heated to redness. *Madan.*

Not apparent upon mere inspection, nor deducible from what is so apparent, but discoverable only by experimentation; relating to what is thus undiscoverable by mere inspection: opposed to *manifest*. The Latin word was applied in the middle ages to the physical sciences and the properties of bodies to which those sciences relate. Its precise meaning is explained in the treatise "De Magnete" of Petrus Peregrinus. He says that an *occult* quality is simply one which is made apparent only upon experimentation, but that in that way it becomes as plain and clear as any other quality, and is no more mysterious. By *occult science* or *philosophy* was meant simply experimental science. There were many occult philosophers in northern Europe in the twelfth and the first part of the thirteenth century; but theology so swallowed up other interests that they are all forgotten except Roger Bacon, who was made prominent by the personal friendship of a pope. The ignorance and superstition of the time confounded occult science with magic.

These are manifest qualities, and their causes only are *occult*. *Newton*, Opticks.

His [Dr. Dee's] personal history may serve as a canvas for the picture of an *occult* philosopher — his reveries, his ambition, and his calamity.

The Aristotelians gave the name of *occult Qualities* . . . to such Qualities only as they supposed to lie hid in Bodies, and to be the unknown Causes of manifest Effects.
Newton, Opticks (ed. 1721), p. 377.

occupancy (ok′ū-pạn-si), *n.* [< *occupan(t)* + *-cy*.] 1. The act of taking possession, or the being in actual possession; more specifically, in *law*, the taking possession of a thing not belonging to any person, and the right acquired by such act; that mode of acquiring property which is founded on the principle that he who takes possession of an ownerless thing, with the design of appropriating it to himself, thereby becomes the owner of it; the act of occupying or holding in actual as distinguished from constructive possession. Formerly, when a man held land pur autre vie (for the life of another), and died before that other, as his estate could not descend to his heir nor revert to the donor until the determination of the specified life, it was considered to belong of right to the first who took possession of it for the remainder of the life, and such possession was termed *general occupancy*. And when the gift was to one and his heirs for the life of another, the heir was said to take as *special occupant*. As the law now stands, however, a man is enabled to devise lands held by him pur autre vie, and if no such devise be made, and there be no special occupant, it goes to his executors or administrators.

As we before observed that *occupancy* gave the right to the temporary use of the soil, so it is agreed upon all hands that *occupancy* gave also the original right to the permanent property in the substance of the earth itself; which excludes every one else but the owner from the use of it.
Blackstone, Com., II. i.

In regard to what a person does as a regular work or a means of earning a livelihood, *occupation* is that which occupies or takes up his time, strength, and thought; *calling* and *vocation* are high words, indicating that one is called by Providence to a particular line of work; *calling* is Anglo-Saxon and familiar, and *vocation* is Latin and lofty (the words are not always used in the higher sense of divine appointment or the call of duty, but it is much better to save them for the expression of that idea); *employment* is essentially the same as *occupation*; *pursuit* is the line of work which one pursues or follows; *business* suggests something of the management of buying and selling; *trade* and *profession* stand over against each other for the less and more intellectual pursuits, as the *trade* of a carpenter, the *profession* of an architect; *trade* is different from *a trade*, the latter being skill in some handicraft: as, being obliged to learn *a trade*, he chose that of a blacksmith; the "learned *professions*" used to be law, medicine, and the ministry, but the number is now increased; *craft* is an old word for *a trade*; *office* suggests the idea of duties to be performed for others. ocean (ō′shạn), *n.* and *a.* [< ME. **ocean*, *occean*, *occian*, *occyan*, < OF. *ocean*, *ocian*, *occean*, *occian*, F. *océan* = Sp. *océano* = Pg. *oceano* = It. *oceano* = D. *oceaan* = G. Sw. Dan. *ocean*, < L. *oceanus*, the ocean, < Gr. *ὠκεανός*, orig. (in Homer) the great stream supposed to encompass the earth (also called by Homer *ὠκεανὸς ποταμός*, or *ῥόος*), 'Ocean-stream' (Milton); also personified, Oceanus, the god of the primeval waters; later, the great outward sea, the Atlantic, as distinguished from the inward sea, the Mediterranean; perhaps orig. 'swift,' < *ὠκύς*, swift.] **I.** *n.* **1.** The body of water which envelops the earth, and covers almost three fourths of its surface with a mean depth—as nearly as can be estimated at the present time—of less than 12,500 feet. Physical geographers, following the lead of the Royal Geographical Society, generally divide the entire oceanic area into five distinct oceans, namely the Arctic, Antarctic, Atlantic, Pacific, and Indian; but these divisions are largely artificial, the lines by which they are indicated being in no small part parallels and meridians. The Arctic and Antarctic oceans, according to this scheme, extend from the north and south poles respectively to the arctic and antarctic circles. The Atlantic extends between the two polar circles, being limited on the east by the land-masses of Europe and Africa and by the meridian extending from Cape Agulhas to the antarctic circle, and on the west by the American land-mass and the meridian of Cape Horn. The Pacific has as its land-limits on the east the American coast, and on the west the Asiatic land-mass, the Philippine Islands, New Guinea, and Australia; its imaginary limits are the meridians of Cape Horn and the South Cape of Tasmania prolonged to meet the antarctic circle. The Indian ocean extends south from the Asiatic mainland to the antarctic circle, its eastern and western imaginary limits having been already given in defining those of the Pacific and Atlantic. The Atlantic and Pacific are also generally divided into North and South Atlantic and North and South Pacific by the equatorial line, thus making seven oceans in all. The chief physiographic ground for this subdivision of the continuous oceanic area is found in the system of ocean currents, for each of the seven oceans has a general eddy-like surface circulation. (See *current*.) There are, however, no natural limits on the south of either the Atlantic, the Pacific, or the Indian oceans, since these all unite with the Antarctic ocean to form one continuous area of water. Hence it would be more philosophical to call the vast area of water occupying the chief part of the southern hemisphere the Southern ocean, as has been done by Herschel and Thomson, and to consider the Atlantic, Pacific, and Indian oceans as immense gulfs or prolongations toward the north of the still greater Southern ocean. (See *hemisphere*, *water*.) The Pacific ocean was most generally designated by the older English navigators as the "South Sea," and this name is still current among the Germans. The smaller divisions of the ocean are, in the order of their respective magnitudes, seas, gulfs, bays, sounds, straits, coves, holes, and harbors (see each of these words). The mean depth of the ocean is probably not far from six times the mean elevation of the land above the ocean-level. The deepest soundings of the ocean, however, give figures a little inferior in amount to those indicating the elevation of the very highest mountain-summits. In several different parts of the ocean depths of over 26,000 feet have been sounded, and one sounding of 31,614 feet (a depth greater than the height of Mt. Everest) has been made near the island of Guam. (See *deep-sea sounding-machine*, under *deep-sea*.) The surface currents are chiefly due to the action of the prevalent winds, by which the water is continually urged forward, but it is deflected by the land-masses and forced to perform an immense gyration or eddy in each ocean. Special features of the several eddies are chiefly due to the configuration of the inclosing land-masses: thus the unsymmetrical outlines of Africa and South America with respect to the equator cause the deflection of a large volume of the warm west-flowing equatorial current from the South Atlantic eddy to the North Atlantic eddy; the openness of the North Atlantic to the Arctic allows the greatest part of this deflected volume of water to drift far northeastward past northwestern Europe, where its temperature is therefore abnormally high for the latitude; the long southward reach of South America turns a great volume of cold east-moving water from the

Southern ocean northward, and thus reduces the temperature of the ocean surface west of Peru to the lowest degree known on the equator. See *monsoon* ★*current*. The surface temperature of the ocean varies from 80° or 85° F. near the equator to about 30° in high northern and southern latitudes; but the distribution of temperature is much affected by the surface currents. The surface currents exert a great influence on the climate of the neighboring lands, through the medium of the winds. Two of the oceanic currents are especially interesting, the Gulf Stream of the Atlantic and the Kuroshiwo of the Pacific (see these terms). Besides the surface currents, there is a general very slow exchange of water always going on in the depths of the ocean between the warmer equatorial and the colder polar waters, brought about chiefly by the difference in temperature and hence in specific gravity of the two. As the result of this, it is found that the temperature of the ocean as a rule diminishes as greater depths are attained, and that the deeper parts, where open to the general circulation, are near the freezing-point. Owing to its salinity, ocean-water (unlike fresh water, which has its maximum density at 39° F. or 4° C.) has its maximum density at its freezing-point, 28° F. or −2⅔° C. Owing to the practical incompressibility of water, the density of the ocean is almost uniform from surface to bottom. A remarkable feature of the ocean-water is the uniformity in the nature and quality of the salts which it contains, provided the specimen has been taken at considerable distance from land. The weight of the salts held in solution by the main ocean is about 3½ per cent. of the whole; of this about three quarters is common salt, one tenth chlorid of magnesium, one twentieth sulphate of magnesia, about the same sulphate of lime, one twenty-fifth chlorid of potassium, and a little over one per cent. bromide of sodium. Other substances are also present in smaller quantity, making in all about twenty-nine elements which have been detected in the ocean-water; many of these, however, exist only in very minute traces. The economical value of the ocean as a source of supply for common salt is considerable; but the quantity thus obtained is not so great as that furnished by mines of rock-salt or by the evaporation of brine got by boring. See *salt*.

class of natural earths consisting of mixtures of the hydrated sesquioxids of iron with various earthy materials, principally kaolin and quartz. These mixtures occur in many localities and have many shades of color, among which tints of red, reddish brown, yellow, and orange are most common. They form a series of valuable and important pigments, used extensively alike by house-painters and artists both in oil and in water-colors. The most usual and common type of ocher-color is a yellow turning neither to red on the one hand nor to brown on the other, but its tone is not as brilliant nor as pure as chrome-yellow. (For varieties, see below.) Ochers in general have much body and are very permanent. Most ochers on burning become redder and darker. Raw sienna and raw umber are varieties of ocher. 2. 2. In *music*: (*a*) A tone on the eighth diatonic degree above or below a given tone; the next higher or lower replicate of a given tone. (*b*) The interval between any tone and a tone on the eighth degree above or below it. (*c*) The harmonic combination of two tones at the interval thus described. (*d*) In a scale, the eighth tone from the bottom, or, more exactly, the tone with which the repetition of the scale begins; the upper key-note or tonic; the eighth: solmizated *do*, like the lower key-note. The typical interval of an octave is that between any tone and its next replicate, which is acoustically represented by the ratio 1 : 2 — that is, in number of vibrations — and is equal to six diatonic whole steps or to twelve semitones. Such an octave is called *perfect* or *major*; an octave one half-step shorter is called *diminished* or *minor*; an octave one half-step longer is called *augmented*. The perfect octave is the most complete consonance after the unison. Indeed, its completeness is often regarded as belonging to a different category from that of the other perfect consonances, except the unison, since it amounts rather to a repetition or reinforcement of the original tone at a higher or lower pitch than to a combination of a new or different tone with it: hence the term *replicate*. In harmony the parallel motion of two voice-parts in perfect octaves is forbidden, except where the mere reinforcement of one voice by another is desired: such octaves are called *consecutive octaves*. See *consecutive intervals*, under *consecutive*. (*e*) In a standard system of tones selected for artistic use, a division or section or group of tones an octave long, the limits of which are fixed by reference to a given or assumed standard tone whose exact pitch may be defined. The tone usually assumed as a starting-point is *middle C* (written on the first leger line below in the treble clef, and on the first above in the bass clef). The octave beginning on the next C below is called the *tenor* or *small octave*; that beginning on the second C below is called the *bass* or *great octave*; that beginning on the third C below is called the *contrabass octave*; while that beginning on middle C itself is called the *alto*, *once-marked*, or *once-accented octave*; that beginning on the next C above is called the *treble*, *twice-marked*, or *twice-accented octave*, etc. See the accompanying table:

The acceptance of the octave as the best unit for thus dividing the series of recognized tones into sections of equal length and value has not been uniform. Ancient Greek music seems to have first used the tetrachord as such a unit; while medieval music employed the hexachord in the same way. The subdivision of the octave portions themselves has also varied greatly in different systems of music. See *scale*. (*f*) In organ-building, a stop whose pipes give tones an octave above the normal pitch of the digitals used; specifically, such a stop of the diapason variety. Also known as the *principal*. Also called *octave-flute*, *octave-stop*. — **3.** Any interval resembling the musical octave in having the vibration-ratio of 1 : 2.

If . . . the solar spectrum be considered in its whole extent, we find in the ultra-red alone, according to Müller, more than two *octaves*, to which must be added more than another *octave* from A to the line R in the ultra-violet. The whole length of the solar spectrum thus embraces consequently about four *octaves*.

Covered or **hidden octaves,** in *music*, the consecutive octaves that are suggested when two voices proceed in similar (not parallel) motion to a perfect octave. Hidden octaves are forbidden in strict counterpoint, and discountenanced in simple harmony, particularly if both voices skip. Compare *hidden fifths*, under *fifth*. — **Rule of the octave,** in the musical theory of the seventeenth and eighteenth centuries, an arbitrary and imperfect scheme of the harmonies proper to the successive tones of the scale. The modern theory that every tone of the scale may be made the basis of a triad has completely displaced this rule. — **Short octave,** in *early organ-building*, the lowest octave of the keyboard when made to consist of only three or four of the digitals most used in the music of the day, instead of the full number. The digitals were set close together, as if belonging to the regular series. This curtailment was simply to avoid the expense of large pipes.

II. *n.* A book or pamphlet every section or gathering of which contains eight leaves, each leaf supposed to be one eighth of the sheet printed: usually written 8*vo*. When the name of the paper of which the book is made is not specified, an octavo is understood as a medium octavo, 6 × 9½ inches. Smaller octavos are — post 8vo, 5½ × 8¼ inches; demy 8vo, 5½ × 8 inches; crown 8vo, 5 × 7½ inches; cap 8vo, 4½ × 7 inches. Larger octavos are — royal 8vo, 6½ × 10 inches; superroyal 8vo, 7 × 11 inches; imperial 8vo, 8¼ × 11½ inches. These are regular octavo folds of established sizes of paper in the United States. Publishers and booksellers describe as octavos only those books or leaves that are larger than 5⅓ × 8 and smaller than 7½ × 11½ inches, irrespective of the number of leaves in a section, which may be twelve or sixteen on thin paper and four or six on thick paper. Larger sizes are described as 4to, smaller sizes as 12mo or 16mo. Bibliographers, as a rule, limit the use of the word *octavo* to books having sections of eight leaves or sixteen pages.

A character belonging to an alphabet of 20 letters used by the ancient Irish and some other Celts in the British islands. An ogham consists of a straight line or a group of straight lines drawn at right angles to a single long stem or main line of writing, and either confined to the one or to the other side of this stem or intersecting it. Some of the lines make an acute angle with the stem. Curves rarely occur. The oghams were cut or carved on wood or stone, and some have come down to us in manuscripts. In lapidary oghamic inscriptions the edge of the stone often served as the main stem. Oghams continued to be used till the ninth or tenth century in Ireland as secret characters.

A. unit of resistance;* it is a little less (0.987) than the true ohm. The international ohm as defined by the International Electrical Congress of 1893 is: The unit of resistance shall be what is known as the international ohm, which is substantially equal to 1,000,000,000 units of resistance of the centimeter-gram-second system of electromagnetic units, and is represented by the resistance offered to an unvarying electric current by a column of mercury at the temperature of melting ice $14\frac{4521}{10000}$ grams in mass, of a constant cross-sectional area, and of the length of $106\frac{3}{10}$ centimeters.

It thus appears that all the forms are ult. from the Gr., the Teut. (except Gothic) and Celtic through the Latin, and the Gothic and older Slavic forms directly from the Greek.] **1.** The general name for a class of bodies which have all or most of the following properties in common: they are neutral bodies having a more or less unctuous feel and viscous consistence, are liquid at ordinary temperatures, are lighter than water, and are insoluble in it, but dissolve in alcohol and more readily in ether, and take fire when heated in air, burning with a luminous smoky flame. The oils are divided into three classes, which have very different chemical composition and properties: the *fatty* or *fixed oils, essential* or *volatile oils,* and the *mineral oils.* The fatty or fixed oils leave a permanent greasy stain on paper, are distinctly unctuous to the feel, and differ from fats chiefly in being liquid at ordinary temperatures. (See *fat.*) Both are triglycerides of the fatty acids. The fatty oils are of both animal and vegetable origin, and are subdivided into the *drying* and the *non-drying oils.* The former class includes all oils which thicken when exposed to the air through the absorption of oxygen, and are converted thereby into varnish, as, for example, linseed-, nut-, poppy-, and hempseed-oils. The non-drying oils when exposed to the air also undergo a change induced by fermentation, resulting in the formation of rancid, disagreeably smelling, acid substances. The fixed vegetable oils are generally prepared by subjecting the seeds of the plant to pressure; the animal oils are, for the most part, the fluid parts of the fat of animals. Fixed oils are used as lubricants, as sources of artificial light, for the manufacture of soaps, and for many other purposes in the arts. Essential or volatile oils are generally obtained by distilling the materials which afford them with water; they are acrid, or fragrant and aromatic, and limpid, and are mostly soluble in alcohol, forming essences. They boil at a temperature considerably above that of boiling water, some of them undergoing partial decomposition. Chemically considered, some are pure hydrocarbons (terpenes), but most of them are mixtures of terpenes with alcohols, aldehydes, and esters. They absorb oxygen quite rapidly, producing ozone, which gives to them bleaching properties. They are used chiefly in medicine and perfumery; and a few of them are extensively employed in the arts as vehicles for colors, and in the manufacture of varnishes, especially oil of turpentine. Mineral oils, petroleum and its derivatives, are mixtures of hydrocarbons, some being exclusively paraffins, others containing varying quantities of hydrocarbons of the olefine and naphthene series. They are only of mineral origin, while the fatty and essential oils are solely of animal and vegetable origin. The mineral oils are now most largely used as sources of artificial light. Oil has been used for religious and ceremonial purposes under Judaism and Christianity as well as in other religions. Under the Mosaic law it was mingled with or poured upon the flour or meal of the offerings at the consecration of priests and Levites, those at the daily sacrifices, etc., and "meat-offerings" (meal-offerings) in general. Kings, priests, and prophets were anointed with oil (whence the title *Messiah* or *Christ*). The oil for the sanctuary and for unction of priests was mixed with myrrh, cinnamon, calamus, and cassia (Ex. xxx. 22–33). In the Christian church anointing inanimate objects with oil signifies hallowing or dedicating them to God, and unction of persons symbolizes the bestowal of the gifts or graces of the Holy Ghost and per-

sonal consecration to God's service. See the phrase *holy oil*, below. For the use of oil in storms at sea, see *oil-distributer*.

oil-distributer (oil′dis-trib″ū-tėr), *n.* Any device or appliance used for the distribution of oil over the surface of the sea for smoothing waves and thus obviating their destructive effect. The first appliance for this purpose, which aimed at economy in the use of oil, was a porous oil-bag attached to a rope, thrown overboard, and towed from the end of a spar or outrigger, the oil slowly filtering through the pores. This has been followed by a variety of inventions, comprising oil-bags placed in water-closet pipes, and devices for distributing oil when towed by a vessel. The oil-distributer of M. Gaston Menier employs a pump discharging water at the water-line, through a series of outboard pipes, the pump also taking oil from a receptacle, and mingling it with the water discharged. The rate of expenditure of oil is indicated by a glass gage, and is regulated by a valve. The oil-distributer of Captain Townsend of the United States Signal Office consists of a hollow metal globe ten inches in diameter, which holds about 1½ gallons of oil, and is kept afloat and held in a nearly fixed position relatively to the surface of the water by an air-chamber. The oil-chamber has an upper and a lower valve, both of which may be adjusted to permit water to flow in through the lower, and the oil displaced by the water to flow out through the upper valve, at a rate controlled by the adjustment. The oil acts mechanically by spreading over the surface of the sea in a tenuous film, which is sufficient to prevent the waves from breaking, and this takes from them their chief power for harm.

The fat is first carefully cleaned from adhering impurities, as bits of flesh, etc., and then thoroughly washed in cold water. It is next rendered at a temperature of 130° to 175° F., and the mixture of oily products thus obtained is slowly and partially cooled, till a part of the stearin and palmatin has crystallized out. Under great hydraulic pressure the parts which still remain fluid are pressed out; after a time these solidify, and are ready for market. This substance has been largely used as an adulterant of butter. When oleomargarin is churned in a liquid state with a certain proportion of fresh milk, a butter is produced which mixes with it, while the buttermilk imparts a flavor of fresh butter to the mass, making so perfect an imitation that it can scarcely be distinguished by taste from fresh butter. A refined fat strongly resembling that obtained from beef-fat is got from lard by similar treatment. Also, in commerce, called simply *oleo*.

I. *a.* Making or causing to smell; effecting or otherwise pertaining to olfaction; having the sense of smell or providing for the exercise of that faculty: as, an *olfactory* organ. The olfactory nerves, present in nearly all vertebrates, are slender filaments in man, about twenty in number, arising from the under surface of the olfactory bulb, or terminal part of the rhinencephalon or olfactory lobe. The lobe is primitively hollow, being a tubular process whose cavity is continuous with that of the prosencephalic ventricle, and it is of much greater relative size in the lower than in the higher vertebrates. In the latter the olfactory lobes are reduced to a pair of solid flattened bands, like bits of tape, and improperly receive the name of *olfactory nerves*, which properly applies only to the numerous filaments arising from the bulbous end of the so-called olfactory nerves, penetrating the cribriform plate of the ethmoid bone through numerous minute foramina, and ramifying through the Schneiderian mucous membrane of the nose. Also *olfactive*. It is one of the lightest of the fixed oils, and of the non-drying class. It is very largely used as a food. In countries where it is produced it is employed in cookery and serves as butter with bread; in England and America its table use is chiefly that of a salad-dressing. In medicine it is employed principally in liniments, ointments, and plasters. Inferior grades serve for lubrication, illumination, woolen-dressing, and soap-making. An omentum is a structure similar to a mesentery, and is in fact a special mesentery connecting the stomach with the liver, spleen, and colon respectively. Hence omenta are commonly distinguished by name. The *gastrohepatic* or *lesser omentum*, *omentum minus*, is a single fold (two layers) of peritoneum extending between the transverse fissure of the liver and the lesser curvature of the stomach. The *gastrosplenic omentum*, of two layers, connects the concavity of the spleen with the fundus of the stomach, and contains the splenic vessels. The *gastrocolic* or *great omentum*, *omentum majus*, also called *epiploön*, is the largest of all the peritoneal duplications, and consists of four layers of peritoneum attached to the greater curvature of the stomach and to the transverse colon, whence it is looped down freely upon the intestines, forming a great flap or apron.

III. *pron.* 1. A single person or thing; an individual; a person; a thing; somebody; some one; something. It is used as a substitute for a noun designating a person or thing, and is in so far of the nature of a personal pronoun, but is capable, unlike a personal pronoun, of being qualified by an indefinite article, an adjective, or other attributive: as, *such a one*, *many a one*, *a good one*, *each one*, *which one*. It is used in the plural also: as, I have left all the bad *ones*.

As well as great.

(*d*) It easily passes, however, from the meaning 'any one' into the collective sense of 'all persons,' 'people generally,' and for this can be substituted *people*, *they*, *we* (if the speaker does not except himself from the general statement), *you* (the person addressed being taken as an example of others in general), or the impersonal passive may be substituted: as, *one* cannot be too careful (*we* cannot, *you* cannot, *they* cannot, *people* cannot be too careful); *one* knows not when (it is not known when). *One* is sometimes virtually a substitute for the first person, employed by a speaker who does not wish to put himself prominently forward: as, *one* does not like to say so, but it is only too true; *one* tries to do *one's* best. *One's self* or *oneself* is the corresponding reflexive: as, *one* must not praise *one's self*.

One would think it were Mistress Overdone's own house.

It is a biennial herbaceous plant with long tubulated leaves, and a swelling pithy stalk. The bulb is composed of closely concentric coats (tunicated), and, with situation and race, varies much in size, in color, which runs from dark-red to white, and in the degree of the characteristic pungency, which is greater in the small red onions than in the larger kinds. The raw onion has the properties of a stimulant, rubefacient, etc., and is wholesome in small quantities. These properties and its pungency depend upon an acrid volatile oil which is expelled by boiling. The native country of the onion is unknown. It has been in use from the days of ancient Egypt, and is said to be more widely grown for culinary purposes than almost any other plant. It endures tropical heat and the coolest temperate climate. Its varieties are very numerous. The onions of Italy, Spain, Mexico, California, and the Bermudas are specially noted for size and quality.

The chief supply at the present time, however, comes from Algeria, where it occurs in large quantity and of fine quality. The trees, with very few exceptions, were what is called the "burr oak," a small variety of a very extensive genus; and the spaces between them, always irregular, and often of singular beauty, have obtained the name of "*openings*"; the two terms combined giving their appellation to this particular species of native forest, under the name of *Oak Openings.* *J. F. Cooper,* Oak Openings, i.

A widening out of a crevice, in consequence of a softening or decomposition of the adjacent rock, which may still remain partly or wholly in its original position, or may have been entirely removed, so as to leave a vacant space of considerable width. ★**opera**[1] (op′e-ra), *n.* [= F. *opéra* = Sp. Pg. *opera* = D. *opera* = G. *oper* = Sw. Dan. *opera,* < It. *opera,* an opera, orig. composition as opposed to improvisation, < L. *opera,* f., work, connected with *opus* (*oper-*), neut., work, toil: see *opus.*] 1. A form of extended dramatic composition in which music is an essential and predominant factor; a musical drama, or a drama in music. The opera is one of the chief forms of musical art; on many grounds it is claimed to be the culminating musical form. At least it affords opportunity for the application of nearly every known resource of musical effect. Its historical beginning was doubtless in the musical declamation of the Greeks, especially in connection with their dramatic representations. The idea of a musical drama was perpetuated during the middle ages under the humble guise of mysteries or miracle-plays, in which singing was an accessory. The modern development began in Italy near the close of the sixteenth century, when an attempt was made to revive the ancient melodic declamation, an attempt which led directly to the discovery and establishment of monody and harmony in the place of the medieval counterpoint, of the recitative and the aria as definite methods of composition, and of instrumentation as an independent element in musical works. The modern opera involves the following distinct musical constituents, combined in various ways: (*a*) *recitatives,* musical declamations, mainly epic or dramatic in character, with or without extended accompaniment; (*b*) *arias, duets,* or *trios,* melodies for one, two, or three voices, constructed in a more or less strict musical form, predominantly lyrical in character, and usually with carefully elaborated accompaniments; (*c*) *choruses* and *concerted numbers* of various form, in which the dramatic element generally predominates, and which are often wrought into noteworthy climaxes of great musical and dramatic interest; (*d*) *instrumental elements,* including both accompaniments and independent passages, the former varying from the merest harmonic groundwork for declamation to a detailed instrumental commentary upon the dramatic emotions and situations as they succeed each other, and the latter including overtures, intermezzi, marches, dances, etc., which either introduce, connect, supply, or embellish the links in the chain of dramatic incident. To these may be added dancing, or the ballet, which is introduced either as an incidental diversion or as a component part of the dramatic action itself. In the older operas the successive numbers or movements are sharply separated from each other, while in recent ones the action is continuous except at one or two principal points. In Italy the opera has had an unbroken course of development since before 1600. It began to be diligently cultivated in France and Germany about 1650, and in England somewhat later. Every leading modern composer, except Mendelssohn, has contributed more or less to its literature. Italian operas have tended toward a lyrical extreme, to the neglect of dramatic consistency and truth, while German operas have strongly emphasized the romantic and strictly dramatic elements. French operas have often sought much for comic or spectacular effects. The Wagnerian theory of the opera presents some peculiarities, especially in the obliteration of the distinction between the recitative and the formal aria, in the remarkable elaboration of the orchestral effects, and in the unification of the poetic, musical, dramatic, and scenic elements, though these characteristics were foreshadowed in the works and theories of earlier masters. The maintenance of expensive opera-houses, with regular seasons of performances annually, is a matter of governmental appropriation in most European countries. The opera has therefore become a powerful factor in the social and artistic life of many cities. Operas are often described by such qualifying terms as *grand* or *serious, dramatic, comic,* etc. Grand operas have an elaborate plot, and the entire work is set to music; while comic operas frequently contain spoken dialogue. In common speech, *German opera* means opera in German; *Italian opera,* opera in Italian, etc. A *ballad-opera* is a light dramatic work into which ballads or popular songs are arbitrarily introduced.

An *Opera* is a poetical tale or fiction, represented by vocal and instrumental musick, adorned with scenes, machines, and dancing. *Dryden,* Albion and Albanius, Pref.

She went from *opera,* park, assembly, play.

2. The score or words of a musical drama, either printed or in manuscript; a libretto.—3. A theater where operas are performed; an opera-house.—4. The administration, revenue, and property of an Italian church or parish.

The principles of construction are various. A common form has a ratchet-wheel connected with registering-dials, and an oscillating lever which by suitable mechanism is made to take up a single ratchet-tooth at each to-and-fro movement of a reciprocating or oscillating part, such as the cross-head of a steam-engine. Another form has a spear-pointed spindle which is connected with a registering mechanism, the whole implement being held in the right hand, and the point of the spindle being pressed into the center at the end of the shaft whose revolutions are desired to be counted. The form is often slenderer than in a common eel; the posterior nostrils are labial—that is, are on the margin or even the inside of the upper lip; and the tongue is attached to the floor of the mouth. In some species the tail is conical or finless; in others it is surrounded by a fin, as usual in eels, whence the two subfamilies *Ophichthyinæ* and *Myrinæ*. ★**ophicleide** (of'i-klīd), *n.* [< Gr. *ὄφις*, a serpent, + *κλείς* (*κλειδ-*), a key: see *clavis*.] A metal musical wind-instrument, invented about 1790, having a large tube of conical bore, bent double, with a cupped mouthpiece. It is essentially a development of the old wooden serpent, and has sometimes been made partly of wood; it is the bass representative of the keyed-bugle family. The tones produced are the harmonics of the tube, as in the horn; but the fundamental tone may be altered by means of keys which control vents in the side of the tube. Eleven such keys are employed, so that the entire compass is over three octaves, beginning (in the usual bass variety) on the third B below the middle C, with all the semitones—all obtainable with exceptional accuracy of intonation. Its resources are therefore considerable, and as its tone is highly resonant and pungent it is an important orchestral instrument. The alto ophicleide is pitched a fifth higher than that described above, while lower varieties also occur.

Ophideres (ō-fid'e-rēz), *n.* [NL. (Boisduval, 1832), prop. **Ophioderes* (cf. Gr. *ὀφιόδειρος*, serpent-necked), < *ὄφις*, a serpent, + *δέρη*, Attic *δειρή*, neck, throat.] The typical genus of *Ophideridæ*, having the palpi spatulate or clavate, and the hind wings luteous. It is very widely distributed in both hemispheres; the species are large and often beautifully colored. *O. fullonica* of South Africa damages oranges by piercing them with its haustellum and sucking the juice.

Ophideridæ (of-i-der'i-dē), *n. pl.* [NL. (Guenée, 1852), < *Ophideres* + *-idæ*.] A family of noctuid moths of large size and striking coloration, represented by *Ophideres* and five other genera in nearly all faunæ except the European.

Ophidia (ō-fid'i-ă), *n. pl.* [NL., pl. of **ophidium*, < Gr. *ὀφίδιον*, dim. in form, but not in sense, of *ὄφις*, a serpent; or improp. for **Ophioidea*, < Gr. *ὄφις*, a serpent, + *εἶδος*, form.] An order of the class *Reptilia*, without developed limbs, with mobile quadrate bone and separate mandibular rami; the snakes or serpents. The name was introduced to replace *Serpentes* of Linnæus, and at first included not only serpents in a proper sense, but certain footless lizards, and even the amphibians of the family *Cœciliidæ*. In *Ophidia* proper there is never any trace of fore limbs, and at most very rudimentary hind limbs, represented externally by mere anal spurs or processes of the integument. There is no sternum. The ribs are very numerous, and are so arranged as to become indirect organs of locomotion by their action upon the skin and so on the scales of the belly. The vertebræ are procœlous, very numerous, not united in any sacrum, and bearing no chevron-bones. The skull has no quadratojugal arch nor parietal foramen; the lower jaw is articulated with a movable quadrate bone, and its rami are connected only by fibrous tissue. The bones of both jaws are generally freely movable, so that the mouth is enormously distensible. The tongue is slender, forked, and protrusile, subserving a tactile office. Teeth are present in one or both jaws, usually in both; they are numerous and sharp, and in venomous *Ophidia* some of the upper ones, usually a single pair, are enlarged, hooked, grooved, or apparently perforate, and thus converted into poison-fangs. The eyes have no movable lids, the cuticle extending directly over the eyeball. The cuticle is scaly, forming many very regularly arranged rows of scales on the upper parts, and usually larger modified scutes on the under side, called *gastrosteges* and *urosteges*, serving to some extent for locomotion. There is a pair of extracloacal penes in the male; the female is oviparous or ovoviviparous. *Ophidia* are variously subdivided—by Duméril and Bibron into *Opoterodonta*, *Aglyphodonta*, *Proteroglypha*, and *Solenoglypha*, an arrangement substantially now current, though with some modifications. Cope's latest arrangement is *Epanodonta*, *Catodonta*, *Tortricina*, which are opoterodont, *Asinea*, which are aglyphodont, *Proteroglypha*, and *Solenoglypha*. There are 20 families and about 300 genera, of which more than 200 belong to the family *Colubridæ* alone. See also cut under *Python*.

(1) In Bonaparte's early systems the *Ophidiidæ* embraced two subfamilies, *Ophidiini* and *Ammodytini*. (2) In Günther's system they are a family of gadoid fishes corresponding to the modern *Ophidioidea*. (3) In Gill's system the family is restricted to those *Ophidioidea* which have the ventral fins under the chin, bifid barbels, and the anus in the anterior half of the length of the fish, represented by four genera. See cut at *Ophidium*.

(Schomburgk, 1841), so called from the serpentine radicle in the embryo; < Gr. *ὄφις*, snake, + *κάρυον*, nut.] A genus of dicotyledonous choripetalous trees of the family *Sabiaceæ*, characterized by orbicular petals; the snakenuts. There are two species. *O. paradoxum*, the snakenut-tree, native in Guiana, is a lofty tree bearing alternate pinnate leaves, panicles of many very small flowers, and roundish one-seeded drupes containing a spirally twisted snake-like embryo. The natives are said to believe that these are transformed into venomous serpents.

Ophiocephalidæ (of″i-ō-se-fal′i-dē), *n. pl.* [NL., < *Ophiocephalus* + *-idæ*.] A family of fishes, typified by the genus *Ophiocephalus;* the walking-fishes. They have a long subcylindric body covered with small scales, and a snake-like head shielded on top with large scales, a long spineless dorsal fin, and usually six-rayed thoracic ventrals. These remarkable fishes breathe air by means of an air-chamber developed over the gills, and die if they breathe water too long. They live in holes in the banks of rivers and pools and similar wet places, and often burrow in the mud. There are 25 or 30 species, natives of the fresh waters of the East Indies and Africa, and some attain a length of from 2 to 4 feet. They are able to survive droughts, living in semi-fluid mud or lying torpid below the hard-baked crust of a tank or pool from which every drop of water has dried up. Respiration is probably suspended during this torpidity, but while the mud is still soft enough to let them come to the surface they rise at intervals to breathe air. This faculty of aërial respiration is due to the development of the accessory branchial chamber; there is, however, no accessory branchial organ, and the opening of the cavity is partly closed by a fold of mucous membrane.

The species are natives of the East. They are furnished with a cavity to supply water to the gills, and are able to live a long time out of water, and often travel considerable distances from one pool to another. The *O. gachua* (the *coramota* or *gachua* of India) is much used for food by the natives. It is generally brought to market and cut up for sale while living. Also, improperly, *Ophicephalus*. *Bloch and Schneider*, 1801.

Engler makes the *Filicales* a class and gives this family ordinal rank, his series *Ophioglossales*. The prothallium is formed of parenchymatous tissue, and is destitute of chlorophyl, being developed underground; the leaves are not circinate in vernation, and the sporangia, which are endogenous in their origin and without annulus, are never borne on the under side of the green frond. They differ further from the true ferns by the absence or imperfect formation of bundle-sheaths and sclerenchyma in the stems and leaves. See *Ophioglossum* and *Botrychium*.

For a single description of negro *ophiolatry* may be cited Bosman's description from Whydah in the Bight of Benin; here the highest order of deities were a kind of snakes which swarm in the villages, reigned over by that huge chief monster, uppermost and greatest and as it were the grandfather of all, who dwelt in his snake-house beneath a lofty tree, and there received the royal offerings of meat and drink, cattle and money and stuffs.

It is chiefly characterized by the compressed, usually-petiolate abdomen and short ovipositor. It includes about 50 genera besides *Ophion*, and many hundred species. All are parasitic upon other insects, and some feed externally upon their hosts. About 400 are catalogued as European, and 300 are described for the United States.

ophiophagous (of-i-of′a-gus), *a.* [< NL. *ophiophagus*, < Gr. *ὀφιοφάγος*, serpent-eating, < *ὄφις*, a serpent, + *φαγεῖν*, eat.] Eating or feeding upon serpents; reptilivorous.

Nor are all snakes of such impoisoning qualities as common opinion presumeth: as is confirmable from the ordinary green snake with us, from several histories of domestick snakes, from *ophiophagous* nations, and such as feed upon serpents. *Sir T. Browne*, Vulg. Err., vi. 28.

Ophiophagus (of-i-of′a-gus), *n.* [NL., < Gr. *ὀφιοφάγος*, serpent-eating: see *ophiophagous*.] A genus of very venomous serpents of the family *Elapidæ*, or of the restricted family *Najadæ*. It is a kind of cobra, very closely related to *Naja*, the chief technical distinction being the presence of postparietal plates on the head. *O. elaps*, the hamadryad, is one of the largest and most deadly of serpents; it is known to attain a length of nearly 12 feet, and is said to reach 15 feet. Its bite is fatal to man in a few moments, and it is said to be able to kill very large quadrupeds. This serpent is found in India and some of the East India islands, as Java, Sumatra, and Borneo, but is fortunately not so common as the ordinary cobra. The generic name refers to its habit of feeding upon other snakes.

ophite[1] (of'īt), *a.* [< Gr. *ὀφίτης,* of or like a serpent, < *ὄφις,* a serpent.] Pertaining to a serpent.

ophite[1] (of'īt), *n.* [< L. *ophites,* also *ophitis,* serpentine stone (see *ophites*), < Gr. *ὀφίτης,* fem. *ὀφῖτις,* of or like a serpent: see *ophite*[1], *a.*] In *petrog.*, a name originally used for greenish rocks of the serpentine family. It was given a more precise application by Palassou to certain diabasic rocks of the Pyrenees consisting chiefly of plagioclase feldspar and green amphibole. These were considered as most closely related to diorite until it was found that the amphibole was paramorphic after augite (= uralite), and the rocks were therefore to be regarded as altered diabase. Used chiefly for the rocks of the Pyrenees; but their characteristic texture is universally called *ophitic.*

Ophite[2] (of'īt), *n.* [< LL. *Ophitæ,* < LGr. *Ὀφῖται* (also *Ὀφιανοί*), pl., < Gr. *ὀφίτης,* of or pertaining to a serpent: see *ophite*[1], *n.*] A member of a Gnostic body, of very early origin, especially prominent in the second century, and existing as late as the sixth century. Its members were so called because they held that the serpent by which Eve was tempted was the impersonation of divine wisdom, the great teacher and civilizer of the human race. They were also called *Naassenes* (from Hebrew *nachāsh,* a serpent). See *Sethian.*

ophites (ō-fī'tēz), *n.* [L., < Gr. *ὀφίτης* (sc. *λίθος*), serpentine stone, so called, according to Pliny, because it is spotted like a snake, or, as was fancifully thought, because a person carrying it might walk among serpents with impunity: see *ophite*[1].] A stone mentioned by various Greek and Latin authors, the word designating several quite different things. It is impossible to identify with certainty any one of the various substances, some of which were unquestionably fabulous, to which the name *ophites* was given by Orpheus, Dioscorides, Pliny, and other classic writers. Pliny distinguishes two kinds of ophite, the hard and the soft. The former may have been some variety of granite; the latter, a variety of serpentine, perhaps the Tuscan gabbro or ophiolite. From a very early time, various rounded stones or petrifactions, more or less egg-shaped in form, and called by various names, *ovum anguinum, ophites, serpent-stone, adderhead, Druidical bead,* etc., have been held in high veneration, and endowed with extraordinary virtues. The ovum anguinum described by Pliny would appear from his description to have been a fossil echinoderm. Glass spindle-whorls, which are known to have been in use within the past four hundred years, have been sold at a recent day as the true ovum anguinum; and fossil echinoderms have also been within a few years treasured as Druidical relics, and regarded as possibly possessing a portion, at least, of the virtues attributed by the ancients to the ophites.

ophitic (ō-fit'ik), *a.* [< *ophite*[1] + *-ic.*] In *petrog.*, noting a texture of igneous rocks of the diabasic or doloritic groups and particularly well exhibited by the ophites of the Pyrenees. In this texture lath-shaped or tabular automorphic plagioclase crystals are embedded in a matrix of xenomorphic augite grains, each of which may inclose several feldspar crystals, producing an approach to the poikilitic texture.

Ophiuchus (of-i-ū'kus), *n.* [L., < Gr. *ὀφιοῦχος* (tr. by L. *Anguitenens* as well as *Serpentarius*), a constellation so called, lit. 'holding a serpent,' < *ὄφις,* a serpent, + *ἔχειν,* hold: see *hectic.*] An ancient northern constellation, representing a man holding a serpent; the Serpent-bearer. Also called *Serpentarius.* The Serpent is now treated as a separate constellation.

Ophiuchus and Serpent.

> Incensed with indignation, Satan stood
> Unterrified, and like a comet burn'd,
> That fires the length of *Ophiuchus* huge
> In the arctic sky. *Milton,* P. L., ii. 709.

Ophiura (of-i-ū'rä), *n.* [NL., < Gr. *ὀφίουρος,* serpent-tailed, < *ὄφις,* a serpent, + *οὐρά,* a tail.] A genus of sand-stars or brittle-stars, variously restricted by different authors. The term is used with great latitude of definition, and gives name to a family and to the whole order to which it belongs. In the late most restricted sense it is discarded, and *Ophiuderma* is substituted, giving name to a family *Ophiodermatidæ.*

ophiuran (of-i-ū'ran), *a.* and *n.* **I.** *a.* Of or pertaining to the genus *Ophiura* in any sense, or to the order *Ophiuroidea.*

(*a*) In the widest sense, the whole order *Ophiuroidea.* (*b*) In a middle sense, the ordinary ophiurans with simple arms. (*c*) In the narrowest sense, the family represented by *Ophiura* or *Ophioderma,* and now called *Ophiodermatidæ.* See cut under *Astrophyton.*

ophiuroid (of-i-ū'roid), *a.* and *n.* [< NL. *Ophiura* + *-oid.*] **I.** *a.* Ophiuran in the widest sense; of or pertaining to the order *Ophiuroidea.*

II. *n.* An ophiuran; any member of the *Ophiuroidea.*

Ophiuroidea (of″i-ū-roi'dē-ä), *n. pl.* [NL., < *Ophiura* + *-oidea.*] An order of echinoderms of the class *Stellerida* or starfishes, containing the brittle-stars, sand-stars, or ophiurans. They are starfishes with a more or less well-defined central disk distinct from and not passing into the arms or rays, and no anal orifice. The axis of the arms is composed of a series of calcareous ossicles called *vertebræ,* each of which is composed of two parts representing the ambulacral plates of ordinary starfishes, and the axis is covered with plates or with continuous integument, usually bearing spines. The ambulacral nerve, water-vessels, and neural canal are within the hollow of the arm. The water-feet or pedicles are without suckers or ampullæ, and protrude between the lateral plates of the arms. The mouth is pentagonal, and each angle is composed of five pieces. The order falls naturally into two leading divisions, according as the arms are simple or branched. These are sometimes called families, *Ophiuridæ* and *Astrophytidæ;* sometimes they are considered as suborders, when the former group is known as *Ophiurida* or *Ophiureæ,* and further subdivided into several families, of which the *Ophiuridæ* proper constitute one. = Syn. The uses of *Ophiura* and its derivatives are almost inextricably blended; but in general (*a*) *Ophiuroida* or *Ophiuroidæ* or *Ophiuroidea* or *Ophiuroideæ* are the major terms of the series, naming the whole group of ophiurans; (*b*) *Ophiurida, Ophiuridæ, Ophiuridea, Ophiurea, Ophiureæ* are middle terms designating the simple ophiurans as distinguished from the euryaleans or *Astrophytidæ;* and (*c*) *Ophiuridæ* is the minor term, designating a restricted family.

See *poppy* and *Papaver*. The opium exudes as a milky juice from shallow incisions made in the partly ripened capsules or heads still on the plant. It soon thickens, is collected by scraping, and kneaded into a homogeneous mass, forming then a reddish-brown sticky gum-like substance of bitter taste and peculiar odor. Opium was known to the Greeks, but was not much used before the seventeenth century; at present it is the most important of all medicines, and its applications the most multifarious, the chief of them being for the relief of pain and the production of sleep. Its habitual use is disastrous and difficult to break up. It is classed as a stimulant narcotic, acting almost exclusively on the central nervous system when taken internally; in large quantities it is a powerful narcotic poison, resulting in a coma characterized by great contraction of the pupils, insensibility, and death. The chief active principle of opium is morphia, but it also contains at least sixteen other alkaloids, some of which have similar properties. (See *narcotine*.) Though opium can be produced in Europe, the United States, etc., its commercial production is limited to countries where labor is cheap and the drug in common use, namely Turkey, Persia, Egypt, India, and China. The Western market is supplied largely from Asia Minor. The Indian export goes chiefly to China.

They have the four kinds of teeth which carnivorous quadrupeds regularly possess (incisors, canines, premolars, and molars), and are omnivorous, eating flesh and carrion, reptiles, insects, and fruits. The head is conical, and the snout somewhat resembles that of a pig; the ears are large, leafy, and rounded; the eyes are small; the whiskers are long; the legs are of proportionate length; both fore and hind paws are five-toed, fashioned like hands, especially the hind ones, which have an opposable thumb; and the tail is generally long, scaly, and prehensile, so that the animal can hang by it. The pelage is coarse; the body is stout, and in size ranges from that of a large cat to that of a small rat. Most female opossums have on the belly a pouch containing the teats, into which the young are received as soon as they are born. They are born extremely small and imperfect. The Virginia opossum has 13 teats, and no doubt may have as many young at a birth, but the number is usually less. Opossums are nocturnal animals; they move on the ground rather slowly and awkwardly, but are more at home in trees, and some of the species are aquatic. Though they are uncleanly, the flesh is white and palatable, especially in the autumn, when they feed much on fruits, and become as fat as pigs. They commonly appear stupid, and in confinement continue sullen and intractable. When caught or threatened with danger they feign death, and will submit to the most brutal maltreatment without showing a sign of animation, whence the proverbial expression "to play possum." Most opossums belong to the genus *Didelphys*, ranging from middle latitudes in the United States through the greater part of South America. The commonest and best-known is *D. virginiana*. There are perhaps a dozen others, among them pouchless ones, as *D. dorsigera*. The yapoks or water-opossums of South America form another genus, *Chironectes*.

Common Opossum (*Didelphys virginiana*).

Amongst the Beasts in Virginia there are two kinds most strange. One of them is the Female *Possowne*, which hath a bag under her belly, out of which she will let forth her young ones, and take them in again at her pleasure. The other is the flying Squerril.

tute what are called in human anatomy the *nates* and *testes* of the brain. The optic nerves arise in part from the optic lobes. These important lobes decrease in relative size as the vertebrate scale ascends; thus, in some fishes they are quite as large as the cerebral hemispheres, and is uncovered upon the surface of the brain; they are quite large in reptiles and birds; small in mammals (in man smallest in proportion both to the cerebrum and to the cerebellum), and entirely covered in, so that they do not appear upon the surface of the brain. See cuts under *cerebral* and *corpus*.—**Optic nerves** (nervi optici), the nerves of sight; the nerves of the special sense of vision, arising from the anterior quadrigeminal and external geniculate bodies and the pulvinar, and terminating in the retina. These nerves are purely sensory, and by means of them the retinal stimulations affect the brain—a process by which vision is accomplished. The optic nerves of opposite sides decussate or form the optic chiasm, and the phrase is sometimes restricted to the part of these nervous trunks beyond the chiasm, the rest being called the *optic tract*. See cuts under *brain*, *corpus*, and *eye*[1].—**Optic neuritis.** See *neuritis*, and cuts under *corpus* and *eye*[1].—**Optic pad,** a pad-like elevation at the end of the arms of a starfish on which an eye is situated.—**Optic papilla.** Same as *optic disk*.—**Optic peduncle,** in crustaceans, an eye-stalk or ophthalmite.—**Optic stalk,** in mollusks, a soft process of the head upon which the eye is supported, as in various snails, etc.; an ommatophore. See *Stylommatophora*.—**Optic thalamus,** a large ganglion of the thalamencephalon, situated upon the crus and separated from the lenticular nucleus by the internal capsule. It gives origin to some of the fibers of the optic nerve. Also called *thalamus*. See cuts under *cerebral* and *corpus*.—**Optic tract** (tractus optici), the part of the whole course of the optic nerves which is between the chiasm and the respective origins of the nerves. In man the tracts are narrow flat bands of white nerve-tissue crossing the crura, to which they are closely attached.—**Optic tubercles,** the corpora quadrigemina. See *bigeminum*.—**Optic vesicles,** in *embryol.*, a pair of vesicles developed from the anterior cerebral vesicles of the embryonic brain.=**Syn.** *Optic, Optical.* The former is chiefly said of the anatomy of the eye and of the physiology of vision, the latter chiefly of the science of optics: as, *optic* nerve, tract, lobe; *optical* angle, center, effect.

★**optical** (op'ti-kal), *a.* [< *optic* + *-al*.] **1.** Relating to or connected with the science of optics; based on or constructed in accordance with the laws of optics: as, *optical* laws; *optical* instruments.—**2.** Pertaining to vision; optic.—**3.** Treating of or studying optics: as, *optical* writers. *Boyle*, Works, I. 673.—**Optical anomaly.** See *anomaly*.—**Optical center,** in a lens, a point so situated that the direction of every ray passing through that point remains unaffected by its transmission through the lens—that is, the incident and emergent parts of the ray are parallel. Geometrically it is defined as the point in which the optical axis of the lens is cut by the line joining the two points where any pair of parallel planes touch the opposite surfaces of the lens. In a double-convex or double-concave lens the optical center lies within the lens; in a plano-convex or plano-concave lens it is the point where the curved surface of the lens is pierced by the axis; in the meniscus and concavo-convex it lies outside of the lens, beyond the surface which is most strongly curved. If the thickness of the lens is small compared with its focal length, the dimensions of object and image will be very nearly proportional to their distances from the optical center. Combinations of several lenses do not possess an optical center.—**Optical circle,** in *physics*, a graduated circle, fitted with the necessary appliances, used for illustrating the laws of refraction and reflection, or, when accurately constructed, for measuring interfacial angles, refractive indices, etc.—**Optical densimeter, equation, glass, meteorology, square,** etc. See the nouns.=**Syn.** See *optic*.

Between the eye and the speculum is a piece of parallel-faced glass with a small dot on its center, exactly in the focus of the eye-glass. This dot is made to pass over the outlines of an object, and a pencil fixed at the eye-end traces the delineation on paper.

The most characteristic moments of the doctrine are two: first, that the Creator selected this universe from a number of others which he might have created; and, second, that all of these presented certain imperfections or disadvantages which omnipotence could not avoid. (*b*) The doctrine that the universe advances on the whole, so as to be tending toward a state in the indefinite future different in its general character from that in the indefinite past. This is better called *evolutionism*. It is opposed to *pessimism*, which holds that the universe is tending to the nothingness from which it sprang, and to *Epicureanism*, which holds that the universe is not tending from any general state to any other general state.

2. The belief, or disposition to believe, that whatever exists is right and good, in some inscrutable way, in spite of all observations to the contrary.

The Christian *optimism* is the recognition that in a spiritual world a spiritual being, as such, cannot find an absolute limit or foreign necessity, against which his life must be broken in pieces; but that, on the contrary, all apparent outward limits, and even death itself, are for it but the means to a higher freedom and realisation of self. *E. Caird*, Hegel, p. 217.

It seemed to chill the flow of the good fellow's *optimism*, so that he assented with but lukewarm satisfaction. *Howells*, Modern Instance, ix.

ondarily the act of choosing. *Election* emphasizes the leaving of some while choosing others. *Choice* and *preference* may apply to that which is chosen; the others not.

=Syn. *Opulence, Wealth, Riches, Affluence.* All these words imply not only the possession of much property, but the possession of it under such circumstances that it can be and is enjoyed. They seem contrasted not only with their opposites, but with the possession of a moderate amount. *Opulence* is a dignified and strong word for *wealth*. *Wealth* and *riches* may mean the property possessed, and *riches* generally does mean it; the others do not. *Affluence* suggests the flow of wealth to one, and resulting free expenditure for objects of desire. There is little difference in the strength of the words.

There are about 200 species, of warmer America, with one species widely scattered throughout the Old World. They are fleshy herbs, shrubby plants, or sometimes trees, their branches usually composed of flattened or globose joints, with hairy tubercles which are set with sharp spines. They bear small scale-like leaves on the younger branches, lateral yellow, red, or purple flowers, and pear-shaped berries. For uses and names, see *cochineal* and *prickly-pear*; also *Indian fig* (under *fig*²), *hedgehog-thistle*, and *tuna*.

(Bentham and Hooker, 1865), < *Opuntia* + *-eæ*.] A tribe of polypetalous plants of the order *Cactaceæ*, distinguished by the short calyx-tube, not prolonged beyond the ovary. It contains 4 genera, of which *Opuntia* is the type and only important one, and about 250 species, principally American. They are succulent perennials, shrubs or sometimes trees, armed with sharp spines. Their usually lateral and large flowers are followed by pear-shaped or roundish berries. See cut under *Opuntia*.

★**opus** (ō′pus), *n.*; pl. *opera* (op′ę-rą). [L., work, a work: see *opera*.] Work; a work, as a literary or musical composition (in the latter use often abbreviated *op.*). The published works of a musical composer are frequently numbered in order for reference: as, *Op.* 23. A single opus may contain two or more numbers: as, *Op.* 48, No. 3.—**Opus Alexandrinum**, Alexandrian work: a type of mosaic pavement consisting of geometric figures in black and red tesseræ on a white ground.—**Opus araneum**, a kind of needlework done in white thread, with figures of men, angels, and animals, liturgical vessels, etc. The name is given especially to such work of the fourteenth and fifteenth centuries.—**Opus filatorium**, the ancient name for fancy work of all sorts done with threads, including drawn and darned embroidery, and all kinds of netting and the like; especially, an embroidery in thread or colored silk on a fabric of small square meshes, sometimes having a pattern cut out of thin stuff applied and edged with needlework.—**Opus incertum** or **opus antiquum**, masonry formed of small rough stones set irregularly in mortar, and in some examples traversed by beds of bricks or tiles.—**Opus insertum**, in *masonry*, regular stonework in which the vertical joints of every course fall in the middle of the blocks of the courses immediately above and below.—**Opus interrasile**, decoration produced by cutting away the ground, leaving the pattern, or cutting out the pattern, so that the openings form the design.—**Opus lateritium**, in *ancient masonry*, brickwork or tilework.—**Opus magnum** or **magnum opus**, a great work; a literary or artistic work on which one spends his best powers.—**Opus musivum**, mosaic.—**Opus operantis**, literally, the work of the worker; in *theol.*, the effect of a sacrament considered as proceeding from the spiritual disposition or condition of the person. The doctrine that the sacraments confer benefits *ex opere operantis*, from the act of the person acting or taking part in them, is regarded as a distinctively Protestant view, in opposition to the doctrine that the benefit is derived *ex opere operato*.—**Opus operatum**, literally, a work wrought; in *scholastic* and *Roman Catholic theology*, the due celebration of a sacrament, considered as necessarily and inherently involving the grace of the sacrament. Sacramental grace is said by Roman Catholic theologians to be conferred *ex opere operato*, 'from the (sacramental) act performed,' the sacrament deriving its power from the institution of Christ, and not from the merit of the minister or recipient. Sacraments are therefore viewed as conveying grace to the recipient, unless by want of the due dispositions, such as faith, love, repentance, etc., he wilfully interposes a barrier which prevents his receiving the grace. Certain schoolmen are thought to have taught that the sacraments produce their full effect in all cases without restriction, and this doctrine has often been imputed by Protestant controversialists to the Roman Catholic Church, instead of that contained in the decrees of the Council of Trent (session vii., canon viii.) as explained by Bellarmine and others, and given above. Anglican theologians have sometimes used this phrase to express the doctrine of the Church of England that the inward grace is one of the two integral parts of a sacrament (Catechism), that the sacraments are signs which are effectual (Article xxv.), and that, as the English bishops declared at the Savoy conference, "sacraments have their effects where the receiver doth not 'ponere obicem,' put any bar against them." *Procter*, Book of Common Prayer (Amer. ed.), p. 124.—**Opus phrygicum**, in the middle ages, embroidery. Compare *Phrygian work* (under *Phrygian*) and *auriphrygia*.—**Opus plumarium**, an old name for *feather-stitch*.—**Opus punctatum**. Same as *pounced work*.—**Opus reticulatum**, in *masonry*, regular stonework or brickwork in square blocks, the courses of which are inclined at an angle of 45° to the horizon, so that the joints resemble a network.—**Opus Saracenicum**, Saracenic work (that is, tapestry, rugs, etc.), imported from the East.—**Opus sectile**, a kind of pavement formed of slabs or tiles of glass or other material, the pieces having a definite size, far larger than the tesseræ of ordinary mosaic. They are sometimes of plain color and sometimes mottled and veined.—**Opus signinum**, a kind of tough cement or stucco used by the ancient Romans to coat the interior of aqueducts, etc.—**Opus spicatum**, herring-bone masonry.—**Opus tessellatum**, a pavement with designs executed in pieces of different colors, called *tesseræ* or *tesselæ*, of larger size and more regular form than the pieces used in mosaic.

Such oracles exerted for centuries a strong influence upon the course of human affairs, the belief of both the medium and the questioner in their divine inspiration being in most cases genuine. The oracles themselves, however, were often ambiguous or at least obscure. The prestige of the chief oracular seats of Greece was powerful in the promotion of good government and justice. After the introduction of Christianity the utterance of oracles gradually ceased. It was a common belief of early Christians that the oracles actually proceeded from evil spirits.

Orang-utan (*Simia satyrus*).

very different from those of man, in whom the height and the reach of the arms are nearly the same. The arms of the orang-utan reach nearly to the ground when the animal stands erect. This attitude is difficult and constrained, and is not ordinarily assumed. The animal is most at home in trees, where it displays extraordinary agility. In walking on level ground it stoops forward, brings the hands to the ground, and swings the body by the long arms, much as a lame person uses crutches. Both hands and feet are long and narrow, with bent knuckles and short thumbs and toes, so that the palms and soles cannot be pressed flat upon plane surfaces. The face, hands, and feet are naked, and the fur is scanty or thin, though rather long; it is of a brownish-red or auburn color. Orang-utans live in trees, where they build large nests and feed on fruits and succulent buds or shoots. The strength of the animal is great in proportion to its size, and when brought to bay it proves a formidable antagonist. Also *orang*.

oratorio (or-ā-tō′ri-ō), *n.* [< It. *oratorio*, < LL. *oratorium*, a place of prayer, an oratory or a chapel. The name was originally given to sacred musical works because they were first performed in the oratory of the church of Sta. Maria in Vallicella, under the patronage of Philip Neri: see *oratory.*] **1.** A place of worship; a chapel; an oratory.—**2.** A form of extended musical composition, more or less dramatic in character, based upon a religious (or occasionally a heroic) theme, and intended to be performed without dramatic action and scenery. The modern oratorio and opera both date from the musical revolution in Italy, about 1600, and were originally indistinguishable from each other, except that one was sacred and the other secular in subject. Both employed the same musical means, such as recitatives, arias, duets, choruses, instrumental accompaniments and passages, and at first even dancing also (for which see *opera*), and both were dramatically presented. But before 1700, particularly in Germany, the oratorio began to be clearly differentiated from the opera, in the relinquishment of dramatic action and accessories, though not usually of dramatic personification, in the more serious and reflective treatment of both arias and choruses, and in the freer use throughout of contrapuntal resources. The oratorio, therefore, came to belong essentially to the class concert music, with more or less of the qualities of church music. The true oratorio style has never been popular in either Italy or France, but has had a remarkable development in both Germany and England. The strong predilection which existed before 1600 for passion-plays led in Germany directly to the cultivation of what is called the *passion-oratorio* or *passion-music*, the theme being the passion and death of Christ, and the whole work being conceived from a decidedly liturgical standpoint. The most famous example of this style is the "Passion according to St. Matthew" of J. S. Bach. In England the works of Handel in the early part of the eighteenth century initiated an interest in the concert oratorio which has been constant and wide-spread. The method of treatment of the English oratorio has varied considerably, from the epic and contemplative to the representative and dramatic, with more or less of the lyrical intermingled. While the oratorio style in general has seldom attained to the passionate intensity and complexity of the opera, it has outstripped the latter in the expression of the lofty spiritual emotions connected with religious thought. Its independence of theatrical limitations has made possible a far more free and elaborate handling of the chorus as a separate artistic means, so that most oratorios are essentially choral works. The oratorio has never occupied the same position of social importance as the opera, but it has perhaps contributed more to the world's store of new artistic conceptions.

The orbits of the planets are elliptical, having the sun in one of the foci; and they all move in these ellipses by this law—that a straight line drawn from the center of the sun to the center of any one of them, termed the *radius vector*, always describes equal areas in equal times. Also, the squares of the times of the planetary revolutions are as the cubes of their mean distances from the sun. These are called *Kepler's laws* (see *law*[1]). The attractions of the planets for one another slightly derange these laws, and cause the orbits to undergo various changes. The satellites, too, move in elliptical orbits, having their respective primaries in one of the foci. The parabolic and hyperbolic paths of comets are also called *orbits*. The *elements of an orbit* are those quantities by which its position and magnitude for the time are determined, such as the major axis and eccentricity, the longitude of the node and the inclination of the plane to the ecliptic, and the longitude of the perihelion. In the ancient astronomy the orbit of a planet is its eccentric or the deferent of its epicycle.

In man the orbits are a pair of quadrilateral pyramidal cavities completely surrounded by bone, and separated from though communicating with the cranial cavity and the nasal and temporal fossæ, and opening forward upon the face, with the apex at the optic foramen where the optic nerve enters. Seven bones enter into the formation of each orbit, the frontal, sphenoid, ethmoid, maxillary, palatal, lacrymal, and malar, of which the first-named three are common to both orbits. Each orbit communicates with surrounding cavities by several openings, the principal of which are—with the cranial cavity by the optic foramen and sphenoidal fissure; with the nasal fossæ by the lacrymal canal; with the temporal and zygomatic fossæ by the sphenomaxillary fissure; with ethmoidal parts by the anterior and posterior ethmoidal foramina; and with the face by supra-orbital, infra-orbital, extra-orbital, and malar foramina. The orbit contains the eye and its associate muscular, vascular, glandular, sustentacular, mucous, and nervous structures.

L. *orchestra*, the place where the senate sat in the theater, also the senate itself, prop. the orchestra), < Gr. *ὀρχήστρα*, a part of the stage where the chorus danced, the orchestra, < *ὀρχεῖσθαι*, dance.] 1. The part of a theater or other public place appropriated to the musicians. (*a*) In theaters, in classic times, the orchestra was a circular or semicircular level space lying between the rising tiers of seats of the auditorium and the stage. In Greek theaters this space was circular, and was allotted to the chorus, which performed its evolutions about the thymele or altar of Dionysus, which occupied the center of the orchestra. Among the Romans the orchestra corresponded nearly to the orchestra of modern play-houses, and was set apart for the seats of senators and other persons of distinction. See diagram under *diazoma*. (*b*) In a modern theater or opera-house, the place

assigned for the orchestra-players is usually the front part of the main floor. In the opera-house at Bayreuth the orchestra is below the level of the floor, so that the players are invisible to the audience. (c) The parquet.

2. In *mod. music*, a company of performers on such instruments as are used in concerted music; a band. (In the United States *band* usually signifies a military band; but in England *band* is interchangeable with *orchestra*.) The historic development of the orchestra as now known did not begin until about 1600, when the independent value of instrumental music was first generally accepted. Up to that time, though many instruments had been known and used, both alone and as supports for vocal music, they had not been systematically combined, nor had concerted music been written for them. The process of experiment, selection, and improvement in construction and mutual adaptation went on steadily until nearly 1800, when the orchestra first arrived at its present proportions. The instruments now used consist of four main groups: (*a*) the *strings*, including violins (first and second), violas, violoncellos, and bass viols, these together constituting the largest and decidedly the most important group, which is often used entirely alone, and is then called the *string-orchestra*; (*b*) the *wood wind*, including flutes, oboes, clarinets, English horns, basset-horns, bassoons, etc., these all being used both to enrich the effect of the strings, and in alternation with them to afford contrasts in tone-quality; (*c*) the *brass wind*, including French horns, trumpets, cornets, trombones, ophicleides, etc., these being also used both in conjunction and in contrast with the other groups, though their decidedly greater sonority makes their introduction necessarily more rare; and (*d*) the *percussives*, including tympani, snare and bass drums, cymbals, bells and triangles, harps, etc., and also sometimes the pianoforte, though the latter is seldom ranked as a true orchestral instrument. The proportions of the several groups are varied somewhat both by composers and by conductors. A *full orchestra* is one in which all these groups are present in fairly complete form; a *small orchestra* is one in which some important instruments are lacking. All the above instruments, except the harp, are essentially monophonic, and the peculiar artistic importance of the orchestra is based upon the fact that every element in the total effect is produced by a solo instrument in the hands of a separate performer. The orchestra is extensively employed both in accompanying vocal music of every kind and in purely instrumental works. Its unlimited capacities for varied effect have led to the production of an extensive musical literature, in which are some of the most famous specimens of musical art. The orchestra is an indispensable factor in all extended works like operas and oratorios. The maintenance of orchestras was originally undertaken by individual princes in the several European states; but they are now either attached to opera-houses or supported by the proceeds of popular concerts.

3. In the early New England churches, the choir-gallery at the end opposite the pulpit: so called because in it were stationed the instrumentalists by whom the singing was accompanied.

The technical use of the word, the disappearance of *or-* as a significant prefix, and the remoteness of the main element *-deal* from its etym. meaning, led to a separation of the word from its actual source, and its treatment as of L. origin; hence the ordinary pron. in three syllables (as if the termination were like that of *real, ideal*, etc.), instead of the orig. two (ôr′dēl).]

I. *n.* **1.** A form of trial to determine guilt or innocence, formerly practised in Europe, and still in parts of the East and by various savage tribes. It consisted in testing the effect of fire, water, poison, etc., upon the accused. Well-known fire-ordeals in England were the handling of red-hot irons, or the walking over heated plowshares. A common form of the water-ordeal was the casting of the accused into water: he was considered innocent if he sank, guilty if he floated. The practice of "ducking witches" is a survival of this water-ordeal, and the phrase "to go through fire and water" probably alludes to those customs. These ordeals were abolished in England in the reign of Henry III., but the wager of battle remained. The ordeal of poison-water is common in Africa; that of burning candles, in Burma; that of eating rice, in Siam, etc.

(*b*) One of the several degrees or grades of the clerical office. In the Roman Catholic Church these orders are bishop, priest (presbyter), deacon, subdeacon, acolyte, exorcist, reader, and doorkeeper. Originally the first three were accounted *major orders* and the others *minor orders*. Since the twelfth century the order of subdeacon has been advanced to the rank of a major order, and the number of orders is generally counted as seven, the orders of bishop and presbyter being regarded as one order in so far as the sacerdotal character belongs to both. In the Orthodox Greek and other Oriental churches the major orders are those of bishop, priest, and deacon, and the minor orders are subdeacon, reader (anagnost), and sometimes singer (psaltes). The orders of bishop, priest, and deacon are known not only as *major* or *holy orders*, but as *apostolic orders*. The orders of subdeacon, acolyte, exorcist, and doorkeeper (ostiary) existed in the Western Church before the middle of the third century; those of subdeacon, exorcist, reader, singer, and doorkeeper were as old as the third or fourth century in the Eastern Church. The Anglican Church retains only the orders of bishop, priest, and deacon. Major orders can be conferred by bishops only. Chorepiscopi, abbots, and priests have sometimes, however, been authorized to confer minor orders.

Milton, P. L., i. 506.

5. (*a*) In *zoöl.*, that taxonomic group which regularly comes next below the class and next above the family, consisting of one or more families, and forming a division (sometimes the whole) of a class. Like other classificatory groups, it has only an arbitrary or conventional taxonomic value. Compare *superorder, suborder*. (*b*) In *bot.*, formerly the most important unit of classification above the genus, corresponding somewhat closely to *family* in zoölogy. With more recent authors the term has been given practically the same rank as in zoölogy, and what were formerly called 'orders' are now called 'families.' See *family*, 6, and *natural order*, under *natural*.

6. A number of persons of the same profession, occupation, or pursuits, constituting a separate class in the community, or united by some special interest.

Shak., R. and J., v. 2. 6.

As a broad general rule, nearly every post-Reformation institute is styled not an *Order* but a "Congregation"; but the only distinction which can be drawn between these two names is that *order* is the wider, and may include several congregations within itself (as the Benedictine *order*, for example, includes the congregations of Cluny and of St. Maur), while a "congregation" is a simple unit, complete in itself, and neither dependent on another institute nor possessed of dependent varieties of its own. *Encyc. Brit.*, XVI. 715.

(*b*) An institution, partly imitated from the medieval and crusading orders of military monks, but generally founded by a sovereign, a national legislature, or a prince of high rank, for the purpose of rewarding meritorious service by the conferring of a dignity. Most honorary orders consist of several classes, known as *knights companions, officers, commanders, grand officers*, and *grand commanders*, otherwise called *grand cross* or *grand cordon*. Many orders have fewer classes, a few having only one. It is customary to divide honorary orders into three ranks: (1) Those which admit only nobles of the highest rank, and among foreigners only sovereign princes or members of reigning families; of this character are the Golden Fleece (Austria and Spain), the Elephant (Denmark), and the Garter (Great Britain): it is usual to regard these three as the existing orders of highest dignity. (2) Those orders which are conferred upon members of noble families only, and sometimes because of the mere fact of noble birth, without special services. (3) The orders of merit, which are supposed to be conferred for services only. Of these the Legion of Honor is the best-known type. Two of the orders of merit may be regarded as somewhat exceptional — the first class of the Order of St. George of Russia and the Order of Maria Theresa of Austria. The former is conferred only upon a commanding general who has defeated an army of 50,000 men, or captured the enemy's capital, or brought about an honorable peace. There is now no person living who has gained this distinction regularly, though it has been given to a foreign sovereign. Other orders of merit approach these more or less nearly, as they are conferred with more or less care. The various orders have their appropriate insignia, consisting usually of a collar of design peculiar to the order, a star, cross, jewel, badge, ribbon, or the like. It is common to speak of an order by its name alone, as the Garter, the Bath. An order is said to be *conferred* or *bestowed* upon the recipient of its distinction; the recipient is said to be *decorated* with such an order; and the word *order* is often applied to the decoration or badge. See *bath, garter, knighthood, star, thistle*, etc.

10. In *rhet.*, the placing of words and members in a sentence in such a manner as to contribute to force and beauty of expression, or to the clear illustration of the subject. —**11.** In *classical arch.*, a column entire (including base, shaft, and capital), with a superincumbent entablature, viewed as forming an architectural whole or the characteristic element of a style. There are five orders — Doric, Ionic, Corinthian, Tuscan, and Composite. (See these adjectives.) Every order consists of two essential parts, a column and an entablature; the column is normally divided into three parts — base, shaft, and

capital; the entablature into three parts also — architrave, frieze, and cornice. The character of an order is displayed not only in its column, but in its general form and details, of which the column is, as it were, the regulator. The Tuscan and Composite are Roman orders, the other three are properly Greek, the Roman renderings of them being so different from the originals as to constitute in fact distinct orders. The Corinthian, though of purely Greek origin, did not come into extensive use before Roman authority was established throughout Greek lands.

The temple on the side of the river seems to be of the greatest antiquity, and was probably built before the *orders* were invented.

12. In *math.*: (*a*) In geometry, the degree of a geometrical form considered as a locus of points, or as determined by the degree of a locus of points. Newton introduced the term *order* as applied to plane curves. Cayley defines the *order of a relation* in *m*-dimensional space as follows: add to the conditions as many arbitrary linear conditions as are necessary to make the multiplicity of the relation equal to *m*; then the number of points satisfying these conditions is the order of the relation. Thus, the *order of a plane curve* is the number of points (real and imaginary) in which this curve is cut by an arbitrary right line. The *order of a non-plane curve* is the number of points in which the curve is cut by a plane. The *order of a surface* is the number of points in which the surface is cut by a right line. The *order of a congruence* is the number of points in which the congruence-lines lying in an arbitrary plane are cut by an arbitrary plane. The *order of a complex* is the number of points in which the curve enveloping the lines of the complex lying in an arbitrary plane is cut by an arbitrary plane. (*b*) In analysis, the number of elementary operations contained in a complex operation; also, that character of a quantity which corresponds to the degree of its algebraic expression. See the phrases below, and also *equation*. —**13.** Established rule, administration, system, or régime.

3. The established or due sequence; the appointed or fixed form; in the Roman Catholic missal and in other Latin liturgies, the established sequence or order for saying mass; the service of the mass (with exclusion of the canon) as preëminent; the ordo. In the medieval English liturgical books the Latin title was *Ordinarium et Canon Missæ*, the ordinary and canon of the mass; in the Roman missal and in general Latin use the title is *Ordo Missæ*, the order of the mass, and the *Canon Missæ*, canon of the mass, is entered as a new title. Hence some writers call only that part of the mass which precedes the canon the *ordinary* or *ordo*.

9. In *her.*, a very common bearing, usually bounded by straight lines, but sometimes by one of the heraldic lines, wavy, nebulé, or the like. See *line*2, 12. The ordinaries are the oldest bearings, and in general the oldest escutcheons are those which are charged only with the ordinaries, or with these primarily, other charges having been added. The bearings most generally admitted as ordinaries are the eight following: bar, bend, chevron, chief, cross, fesse, pale, and saltire; but most writers add one, some two, and others a greater number, namely one or more of the following: bend sinister, inescutcheon, quarter or franc-quartier, pile, bordure. By some writers also the subordinaries and ordinaries are considered together under one head. The ordinaries are often called *honorable ordinaries*, to distinguish them from the subordinaries.

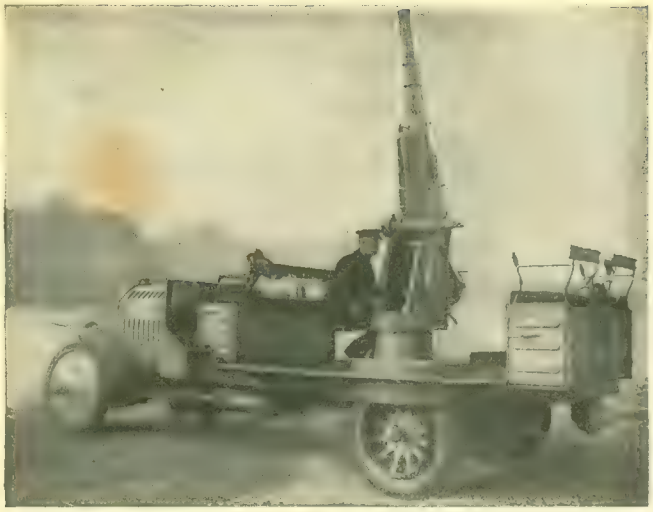
Range, 6,000 yards. Explosive rounds per minute, 250. Firing continues as long as the pressure on the trigger is retained.



4 4.7 field howitzer. Model 1906. Range, 6,500 yards. Weight of explosive shot, 60 pounds. Charge, 3.5 pounds of smokeless powder. The peculiar mechanism permits of a 40-degree angle of elevation.

5 Mountain gun. Modified type of Vickers-Maxim 75-millimeter gun. Can be elevated to 35 degrees. Range, 5,500 yards. It fires an explosive shot of 18 pounds and can be dis-assembled in less than one minute.

6 Naval 8-inch 45-caliber gun. Range, 5 miles. Charge, 81 pounds of nitrocellulose. Weight of projectile, 260 pounds. Weight of gun, 18.70 tons. Muzzle velocity, 2,700 feet per second. Length of gun, 369 inches. This type of gun is designed for vessels of the Virginia and Connecticut class.

1 **Ten-inch disappearing gun and carriage** in firing position. Model of 1896. Charge, 160 pounds of smokeless powder. Weight of projectile, 604 pounds. Muzzle velocity, 2,300 feet per second. Range, 10 miles.

2 **Modified** type of the Vickers-Maxim automatic rapid-fire 30-caliber machine-gun. Fires 600 shots per minute. Range, 3,000 yards. Regarded as one of the most perfect types of rapid-fire guns ever made. The cylinder surrounding the barrel is filled with water. The recoil of the gun loads it. Continued rapid fire is obtained by retaining the finger-pressure on the trigger.

3 **Three**-inch light-artillery field-gun. Will fire 40 shots per minute. Range, 6,500 yards. Weight of shot, 15 pounds. Charge, 24 ounces of smokeless powder. Charges of shrapnel fired from this gun may be made to burst at any given time by the accurate setting of the time fuses.

4 **German** balloon-gun, made by Krupp, mounted on an automobile chassis. Specially designed for the destruction of balloons and airships.

5 **Three**-inch light-artillery field-gun. Same as No. 3, but a rear view.

6 **High**-power 14-inch gun and carriage. Weight of gun, 111,900 pounds. Length, 495 inches. Charge, 329 pounds of smokeless powder. Weight of projectile, 1,660 pounds. Muzzle velocity, 2,150 feet per second. Maximum range, 16,949 yards.

7 **Twelve**-inch coast-defense mortar. Weight of explosive projectile, 840 pounds. Charge, 81 pounds of smokeless powder. In firing for extreme range at about 65 degrees elevation the projectile will rise as high as the range (17,000 yards) and remain in the air 72 seconds before striking.

NOTE.—It will be noticed that the weights of powder charges are very light as compared with the weights of the projectiles. Smokeless powder is used in heavy ordnance, since it is much safer to handle and possesses almost double the strength of common black powder, producing, as it does, pressures of from 1,500 to 44,000 pounds to the square inch.

2. The act of admitting to holy orders, or to the Christian ministry; the rite of conferring holy orders or investing with ministerial or sacerdotal power and authority. In episcopal churches, including the Roman Catholic Church, the Greek and other Oriental churches, and the Anglican Church, ordination consists in imposition of hands by a bishop upon the candidate, thus admitting him to one of the holy orders, and conferring on him the powers of that order and authority to perform its functions. The act of elevation to the episcopate is in strict technical use called *consecration*, not *ordination*. *Ordination* in its wider sense includes admission to the minor orders, which are usually conferred in the Roman Catholic Church by a bishop, but can be bestowed by an abbot, the act of admission consisting in the tradition (delivery) of the instruments. In Presbyterian churches the power of ordination rests with the presbytery, who appoint one or more of their number to conduct the ordination ceremonies, which include laying on of hands. In Congregational and Baptist churches ordination is customarily performed by the pastors of other churches (of the same denomination), but is regarded as necessary only for the preservation of church order; and the service is regarded as conferring no special religious authority. See *institution*, *induction*, *installation*.

As for *Ordination*, what is it but the laying on of hands, an outward signe or symbol of admission?

ordines, *n.* Plural of *ordo.*

ordnance (ôrd′nạns), *n.* [An old form of *ordinance*: see *ordinance*, 5. Cf. *ordonnance.*] The general name for all kinds of weapons used in warfare; cannon or great guns collectively, including mortars and howitzers; artillery. As a technical term, it designates all heavy pieces fired from carriages. (See classification under *cannon.*) Most guns of modern construction are breech-loading rifled arms. Classified according to the material used, cannon are *bronze*, *cast-iron*, *wrought-iron*, *steel*, or *composite* (*wrought-iron* and *steel*) guns; according to the method of construction, they are called *solid* or *built-up* guns. The most modern type of heavy gun is an all-steel built-up breech-loading gun, with a Krupp or interrupted-screw fermeture. Formerly sometimes used in the plural.

Board of ordnance. (*a*†) Formerly, in Great Britain, a board, consisting of a master-general, surveyor-general, clerk, and storekeeper (usually members of Parliament), which provided the army and navy with guns, ammunition, and arms of every description, and superintended the providing of stores, equipment, etc. The Crimean disasters in 1854 showed the defects of this board, which was shortly afterward dissolved. (*b*) A board composed of United States ordnance-officers distinguished for their attainments in the theory and practice of heavy ordnance, its construction and use, whose duty it is to conduct experiments, and test and report upon all ordnance subjects referred to it by the chief of ordnance. This board is designated by the Secretary of War, and is advisory to the chief of ordnance of the army.—**Bureau of Ordnance.** See *Department of the Navy*, under *department.*—**Master of the ordnance.** See *master*[1].—**Ordnance corps.** Same as *ordnance department.*—**Ordnance department.** See *department.*—**Ordnance storekeeper.** See *storekeeper.*—**Ordnance stores,** a general phrase including everything pertaining to the manufacture, equipment, and service of ordnance or artillery. It comprises all projectiles and explosives, pyrotechnic stores, gun-carriages, caissons, limbers, mortar-beds, cavalry and artillery forges, battery-wagons, and all machines for mechanical manœuvers and for transportation, tools and materials for fabrication, repair, or preservation, all small-arms, accoutrements, and equipments for artillery, cavalry, and infantry. The phrase "ordnance and ordnance stores," covers everything in the form of a weapon that is used in war, together with all the materials and appliances necessary for their construction, repair, preservation, and use.—**Ordnance survey,** the survey of Great Britain, undertaken by the government, and executed by select corps of the Royal Engineers and civilians. The charts exhibit, in addition to the ordinary features of a map, the extent and limits of properties; and rivers, roads, houses, etc., are laid down on them in their just proportions, and not, as in ordinary maps, exaggerated. The scale adopted by the British government is, for towns having 4,000 or more inhabitants, $\frac{1}{500}$ of the linear measurement, which is equivalent to 126.72 inches to a mile, or 1 inch to 41⅔ feet; for parishes (in cultivated districts), $\frac{1}{2500}$ of the linear measurement, equal to 25.344 inches to a mile, or very nearly 1 square inch to an acre; for counties, 6 inches to a mile; for the kingdom, a general map, 1 inch to a mile. The purposes to which these large plans may be applied are as estate plans, for managing, draining, and otherwise improving land, for facilitating its transfer by registering sales and incumbrances, and as public maps, according to which local or general taxes may be levied, and roads, railways, canals, and other public works laid out and executed.—**Rifled ordnance.** See *rifled cannon*, under *cannon.*

Ordovician (ôr-dō-vish′ian), *a.* [Named from the *Ordovices*, an ancient British (North Welsh) tribe.] An epithet applied by C. Lapworth to a series of rocks not capable of exact separation from those underlying or overlying them, either stratigraphically or paleontologically, but which have been the subject of much discussion among English geologists. They form a part of the Lower Silurian of Murchison, more or less of the Upper Cambrian of Sedgwick, the Cambro-Silurian of Jukes, the Siluro-Cambrian of some authors, the second fauna of Barrande, etc. As limited in Wales, according to H. B. Woodward, the Ordovician may be said to extend from the base of the Arenig series to the base of the Llandovery. Graptolites and trilobites are the most abundant fossils, and there is a large amount of intercalated volcanic material. The name Ordovician is not accepted in the text-book of geology issued by Sir A. Geikie, director of the Geological Survey of Great Britain 1882–1901, nor has it any place in American Silurian geology as worked out by the New York and Pennsylvania Surveys, nor can the strata thus named in England be strictly parallelized with any one or more divisions of the Silurian as established in the United States.

ordure (or′dụr), *n.* [< ME. *ordure*, < OF. (and F.) *ordure* (= It. *ordura*), filth, excrement, < *ord* = It. *orrido*, foul, dirty, nasty, < L. *horridus*, horrid: see *horrid.*] Dung; excrement; feces.

Skt. *ayas*, metal.] **1.** A metalliferous mineral or rock, especially one which is of sufficient value to be mined. A mixture of a native metal with rock or veinstone is not usually called *ore*, however, it being understood that in an ore proper the metal is in a mineralized condition—that is, exists in combination with some mineralizer, as sulphur or oxygen. The ore and veinstone together constitute the mass of the metalliferous deposit, vein or lode. The ore as mined is usually more or less mixed with veinstone, and from this it is separated, as completely as may be convenient or possible, by dressing. It then usually goes to the smelter, who, by means of a more or less complicated series of operations, frees it from the worthless material which still remains mechanically mixed with it, and also sets it free from its chemical combination with the substances by which it is mineralized.

2. Metal; sometimes, specifically, a precious metal, as gold.

It is quite frequently more or less pulverulent, staining the hands deep red, and hence called *dyestone ore*. Historically, the principle of sounding a pipe pneumatically has been known from the earliest times. The combination of pipes or whistles into graduated series, so as to produce the tones of some sort of scale, appears in the primitive Pan's-pipe and in the Chinese cheng, both of which are blown by the breath, the latter being perhaps

the actual prototype of the modern organ. Instruments of this general class seem to have been used in Europe from the first Christian centuries, having some apparatus for furnishing compressed air and a set of pipes the sounding of which was variously controlled. Soon after the tenth century great improvements were made, affecting every part of the mechanism. The process of mechanical development has been continuous ever since, and is still going on. The original impetus to this steady progress is due to the fact that the pipe-organ has been recognized ever since the fourth or fifth century as preëminently the church musical instrument. Until the sixteenth century no other instrument commanded the careful study of educated musicians. Its application to purely concert uses is comparatively recent. The modern pipe-organ consists essentially of three mechanical systems: the *wind-supply*, the compressed air used being technically called *wind;* the *pipework*, including the entire sound-producing apparatus; and the *action*, the mechanism by which the player controls the whole. The *wind-supply* includes two or more *feeders*, oblique bellows which are operated either by hand or by a water, gas, steam, or electric motor or engine; a *storage-bellows*, horizontal bellows into which the feeders open, and in which the air is kept at a uniform pressure by means of weights; *wind-trunks*, distributing the compressed air to the several parts of the instrument; and *wind-chests*, boxes directly under the pipes, in which are the valves for admitting the air to particular pipes or sets of pipes. Occasionally certain solo pipes are supplied with air from a special storage-bellows in which the tension is made greater by extra weights; such pipes are said to be *on extra* or *heavy wind*. The *pipework* includes a great variety of different kinds of pipes, made either of metal or of wood, arranged in sets called *stops* or *registers*, at least one pipe being usually provided in each set for each digital of the keyboard. In general, all pipes are either *flue-pipes*, which are either open at the upper end or plugged, or *reed-pipes*, the former producing tones through the impact of a stream of air upon the sharp edge or lip of a mouth in the side of the pipe, and the latter producing tones by the vibration of a tongue or reed placed over or in an orifice through which the air passes. (See *pipe*.) The pipes in a given set or stop are alike, except in size and pitch. The four principal qualities of tone produced are the true *organ-tone*, given by open metal flue-pipes of broad scale; the *flute-tone*, given by stopped wooden flue-pipes; the *string-tone*, given by open metal flue-pipes of narrow scale; and the *reed-tone*, given by reed-pipes of various shape and material. A stop whose tones correspond exactly with the normal pitch of the digitals with which the several pipes are connected is called an *eight-feet stop;* one whose tones are uniformly an octave lower is called a *sixteen-feet stop;* while those whose tones are uniformly one or two octaves higher are called *four-feet* and *two-feet stops* respectively. Stops whose tones are different from the normal pitch of the digitals used, or from their upper or lower octaves, are called *mutation-stops*, in distinction from the above *foundation-stops*. Stops that have more than one pipe to the digital are called *mixture-stops* or *mixtures*. It is customary to group together several stops of different construction, tone-quality, and pitch upon a single wind-chest, and such a group of stops constitutes a *partial organ*. Usually from two to five such groups of stops or partial organs are introduced, such as the *great organ*, the chief and most sonorous of all; the *swell-organ*, so called because shut up in a tight box one side of which consists of shutters which may be opened or shut so as to let out or muffle the sound; the *choir-organ*, specially intended for accompanying either voices or other stops of the organ itself; the *solo-organ*, providing stops of very conspicuous power and individuality; and the *pedal organ*, including deep-toned stops played from a keyboard for the feet, and supplying the fundamental tones of the harmony. The number, order, power, and quality of the stops placed in these several partial organs vary widely. Each is complete in itself, having its own wind-chest and keyboard, so that it can be used independently of the others; but by means of couplers any pair may be played conjointly from a single keyboard. (See *coupler*.) The *action* includes one keyboard for each partial organ, a stop-knob for each stop, a knob or piston for each coupler, a swell-pedal, combination pedals, etc. Keyboards for the hands are called *manuals*, and those for the feet *pedals*, each being made up of the usual white and black digitals or keys. The manuals usually have a compass of nearly or about five octaves, beginning on the second C below middle C, while the pedals have about half this compass, beginning an octave lower. The manuals are placed above each other in a desk-like case; when there are two, the lower belongs to the great organ, and the upper to the swell-organ; when there are three, the lowest belongs to the choir-organ. The stop knobs, bearing the names of the stops, are placed on both sides of the manuals, and are grouped according to the partial organs to which they belong. When a stop is to be used, its knob is pulled forward, or "drawn." Frequently *combination pedals* or *pistons* are provided, by which several knobs may be drawn or retired at once. Sometimes, also, a *crescendo pedal* is introduced, by which the entire resources of the instrument may be gradually called into action. The keyboards may be combined in various ways by means of couplers. The digitals of the keyboards are connected with the valves in the wind-chests by a complicated series of stickers, squares, rollers, trackers, etc., which are almost entirely made of wood. In large organs the friction of the key-action is so great that a pneumatic or electric action is employed, in which the digitals merely make connections so that compressed air or electricity may do the work. The stop-knobs are connected with the wind-chests by similar systems of levers, rods, squares, etc., which are also often pneumatically or electrically manipulated. When a digital on one of the keyboards is depressed, a valve is opened from the wind-chest belonging to that keyboard, admitting the compressed air to a groove or channel over which stand all the pipes belonging to the digital: only those pipes, however, are sounded that belong to the stops whose stop-knobs happen to be drawn. The opening and closing of the shutters of the *swell-box* is manipulated through a special *swell-pedal*. Various other mechanical accessories are often added, such as the *tremulant*, a device by which an oscillating tension is given to the air in one of the wind-trunks, the *pedal-check*, the *bellows-signal*, etc. The history of organ music until the sixteenth century was coincident with that of vocal music, for which it merely afforded a basis; but since that time it has had a remarkable independent development, particularly in the works of J. S. Bach. The organ has been much used in conjunction with choral music to enhance broad harmonic effects; and lately it has been also applied to the elaborate imitation of orchestral music. It remains the distinctively church instrument, although it is often found in concert-halls and in opera-houses. Formerly the instrument was often spoken of as *a pair of organs*, or simply *organs*.

His vois was merier than the merye *orgon*
On masse days that in the chirche goon.
Chaucer, Nun's Priest's Tale, l. 32.

The cheife Church of this citty is curiously carved within and without, furnished with a *paire of organs*, and a most magnificent font, all of copper.

The rods of Corti are long, narrow, rigid columnar cells, rising from a conical base and arranged in an inner and an outer row; they incline toward each other and interlock by their heads, forming thus the arch of Corti. Adjoining the inner acoustic rods there is a single row, and externally to the outer rods four to six (in man) rows of acoustic hair-cells; these are long columns, inclined with the rods, attached to the basilar membrane, and terminating in a rounded extremity furnished with a curved row of short, stiff, terminal, hair-like filaments. 2. An instrument of thought. Originally applied to the logical theory of demonstration, and then by the Peripatetics to the whole of logic, especially to the topics of Aristotle or the rules for probable reasoning, as being only an instrument or aid to philosophy, and not meriting the higher place of a part of philosophy claimed for it by the Stoics and most of the Academics; thence given as a title to the logical treatises of Aristotle.

R. Choate, Addresses, p. 259.

The theory of judicial evidence is constantly misstated or misconceived even in this country [England], and the English law on the subject is too often described as being that which it is its chief distinction not to be — that is, as an *Organon*, as a sort of contrivance for the discovery of truth which English lawyers have patented.

They are also known as *tussock-moths*, from the long tufts of hair with which the caterpillars are furnished. The females are incapable of flight, having only rudimentary wings. In the male the body is slender; the proboscis is short; the palpi are short and very hairy, with the third joint shortest; the antennæ are broadly pectinate; the hind tibiæ have two short apical spurs, or four long ones; and the wings are broad, extending beyond the end of the abdomen. 'mountain-copper,' < ὄρος, mountain, + χαλκός, copper: see *chalcitis*.] The equivalent in English of the Greek ὀρείχαλκος, the name of a metallic alloy or metal of brilliant luster, mentioned by Greek authors of a very early date, and considered by them as worthy to be classed with gold and silver in respect of value. Plato, while often speaking of it, admits that orichalc was no longer to be had in his time; and some (Aristotle, it is said, among them) deny that any such metal ever existed. The word passed into Latin under the form of *orichalcum*, and later that of *aurichalcum*. Although sometimes used as the name of brass (as by Strabo, who, with as near an approach to accuracy as was possible in those days, describes the method of manufacturing that metal and calls the alloy *orichalcum*), it had in general — even down to the middle ages — a more or less uncertain meaning, standing sometimes for an entirely ideal and very precious substance and sometimes for an ordinary metal or alloy (as copper or bronze), but having a peculiar value on account of the manner in which it was made, or the locality whence it came.

It projects from the outer face of the wall, being in plan semi-hexagonal, semi-octagonal, or rectangular, etc., and is supported on brackets, corbels, or corbeling. The only two instances . . . in which it [orientation] is departed from [in the Eastern Church] are those of Haghios Georgios . . . in Crete, which *orientates* north, and of the Asomatoi . . . in the Morea, which *orientates* south. *J. M. Neale*, Eastern Church, i. 222.

The act of turning or the state of being turned toward the east. Specifically—(*a*) The position of worshipers facing toward the east, or, in Christian worship, toward that end of a church which is known as the eastern end; especially (*eccles.*), that position of a priest celebrating the eucharist in which he faces the altar; the eastward position.

(*b*) Such a position of a corpse in a grave that the head is toward the west and the feet toward the east.

The same symbolism of east and west has taken shape in actual ceremony, giving rise to a series of practices concerning the posture of the dead in their graves and the living in their temples, practices which may be classed under the general heading of *Orientation.*
E. B. Tylor, Prim. Culture, II. 382.

(*c*) The construction or position of a church so that it has that end which contains the chancel or sanctuary in the direction of the east.

The very ancient practice of *orientation* in the building of churches can hardly be set aside as "a High Church piece of pedantry." Allusion to worship towards the east may be found in the early liturgies and Church fathers; and in this country, at least, *orientation* has been practised from the first introduction of Christianity into these islands down to the present time, with the interruption of the Great Rebellion. *N. and Q.*, 7th ser., VII. 469.

(*d*) Hence, the position of a building or of any object with reference to any point of the compass.

The later builders of Thebes appear to have had no notion of *orientation*, but to have placed their buildings and tombs so as to avoid regularity, and facing in every conceivable direction. *J. Fergusson*, Hist. Arch., I. 96.

But let a man venture into an unfamiliar field, or where his results are not continually checked by experience, and all history shows that the most masculine intellect will ofttimes lose his *orientation* and waste his efforts in directions which bring him no nearer to his goal, or even carry him entirely astray. *C. S. Peirce*, in Pop. Sci. Mo., XII. 4.

4. The process of determining direction or relative position in general.

Tympanic sensibility plays no role in auditive *orientation.* *Amer. Jour. Psychol.*, I. 510.

5. In *crystal.*, the process of placing a crystal in proper position so as to show the relation of its planes to the assumed axes.—6. In *zoöl.*, the faculty or instinct by which birds and other animals find their way home after being carried to a distance. It is well illustrated by homing pigeons. (See *homing.*) A striking instance of orientation is also afforded by swallows. Thus, a swallow nesting in New England, for example, and wintering in Panama, can return to the rafter in the barn where its nest was the previous year. All the regular and periodical migrations of birds imply the faculty of orientation.

Origenism (or'i-jen-izm), *n.* [< *Origen* (see def.) + *-ism.*] The opinions held by or attributed to the Greek father Origen of Alexandria (born about A. D. 185, died about 253). The main characteristics of Origen's teaching were its union of philosophical speculation with Christian doctrine and its mystical and allegorizing interpretation of Scripture. He insisted especially on the unity of all creation; he regarded Scripture as having generally a threefold sense, literal, moral, and mystical; he held the essential divinity and eternity of each person of the Trinity, but maintained that the Son is inferior to the Father and the Holy Ghost to the Son; he was the first to formulate the orthodox doctrine of eternal generation; he rejected prayer to Christ, though he defended prayer in the name of Christ; he regarded all sin as proceeding from a voluntary and moral self-determination to evil; he held that the human soul of Christ preëxisted with other human souls; that the soul came into the body as a penalty for sin in a preëxistent state; and he believed in a further moral progress and development after the present life, and defended as a probable opinion the restoration and final salvation of all men and of the fallen angels.
